**Overview**

The kinematic hardening models:

- are used to simulate the inelastic behavior of materials that are subjected to cyclic loading;
- include a linear kinematic hardening model and a nonlinear isotropic/kinematic hardening model;
- can be used in any procedure that uses elements with displacement degrees of freedom;
- in ABAQUS/Standard cannot be used in adiabatic analyses, and the nonlinear isotropic/kinematic hardening model cannot be used in coupled temperature-displacement analyses;
- can be used to model rate-dependent yield;
- can be used with creep and swelling in ABAQUS/Standard; and
- require the use of the linear elasticity material model to define the elastic part of the response.

---

**Yield surfaces**

The kinematic hardening models used to model the behavior of metals subjected to cyclic loading are pressure-independent plasticity models; in other words, yielding of the metals is independent of the equivalent pressure stress. These models are suited for most metals subjected to cyclic loading conditions, except voided metals. The linear kinematic hardening model can be used with the Mises or Hill yield surface. The nonlinear isotropic/kinematic model can be used only with the Mises yield surface in

**Zentropy** Zi-Kui Liu, 2024-08-23 This book compiles selected publications authored or co authored by the editor to present a comprehensive understanding of following topics 1 density functional theory and CALPHAD modeling 2 computational tools and 3 applications of computational thermodynamics It is noted that while entropy at one scale is well represented by standard statistical mechanics in terms of probability of individual configurations at that scale the theory capable of counting total entropy of a system from different scales is lacking The zentropy theory provides a nested form for configurational entropy enabling multiscale modeling to account for disorder and fluctuations from the electronic scale based on quantum mechanics to the experimental scale based on statistical mechanics using free energies of individual configurations rather than their total energies in standard statistical mechanics The predictions from the zentropy theory demonstrate remarkable agreements with experimental observations for magnetic transitions and associated emergent behaviors of strongly correlated metals and oxides including singularity and instability at critical points and positive and negative thermal expansions without the need of additional truncated models and fitting model parameters beyond density function theory This paves the way to provide the predicted phase equilibrium data for high throughput predictive CALPHAD modeling of complex material systems and those individual configurations may thus be considered as the genomic building blocks of individual phases in the spirit of Materials Genome
