Before you start the work, isolate the drive from all dangerous voltage sources and install a lock-out tag-out to keep the drive from starting. (Always lock for 15 minutes after disconnecting the input power to let the internal capacitors drain completely.)

1. To install the drive to a DIN rail for frame sizes RS and R4:
2. Push the locking part to the left. If necessary, use a flat-head screwdriver.
3. Push the locking tab of the drive onto the top edge of the DIN rail.
4. Push the drive against the bottom edge of the DIN rail.
5. Release the locking button.
6. Move the locking pin to the right.
7. The drive then is attached to the rail (not installed).
8. Press the **LOCK** button on the control panel to lock the drive from the DIN rail.

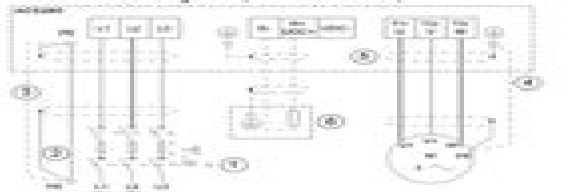

**Warning:** Do not do voltage tests on a insulation resistance tester on the drive, because this is a severe danger to life.

- 13.2.10 **Interconnecting cables**
- 13.2.10.1 **General**
- There are three types of interconnecting construction: (1) fibre-optic construction (FPC); (2) twisted-pair construction (TPC); and (3) coaxial construction (CC). The construction of the cable is determined by the type of signal to be transmitted. The construction of the cable is determined by the type of signal to be transmitted. The construction of the cable is determined by the type of signal to be transmitted.
- 13.2.10.2 **Fibre-optic construction**
- Fibre-optic construction is used for the transmission of optical signals. It consists of a core, a cladding, and a protective jacket. The core is the central part of the cable through which the light signal travels. The cladding is the layer surrounding the core, which reflects the light back into the core. The protective jacket is the outermost layer of the cable, which protects the core and cladding from physical damage.
- 13.2.10.3 **Twisted-pair construction**
- Twisted-pair construction is used for the transmission of electrical signals. It consists of two twisted conductors. The twisting of the conductors helps to reduce crosstalk and electromagnetic interference. Twisted-pair construction is commonly used in local area networks (LANs) and telephone systems.
- 13.2.10.4 **Coaxial construction**
- Coaxial construction is used for the transmission of electrical signals. It consists of a central conductor, an insulating dielectric, an outer conductor, and a protective jacket. Coaxial construction is commonly used for cable television, radio, and television broadcasting.
- 13.2.10.5 **Selection criteria**
- The selection of the interconnecting construction is based on several factors, including the type of signal to be transmitted, the distance of the transmission, the environment, and the cost. - (11) *Probably not* (non-)linearly separable (possibly under some ground-truth changes).
- (12) *Definitely not* (non-)linearly separable (possibly under some ground-truth changes).

**Connection procedure**

1. Which of the following is **not** a characteristic of the cell wall of a plant cell?
- It is made of cellulose.
  - It is rigid and provides structural support.
  - It is permeable to water and small molecules.
  - It is composed of a single layer of cells.

- Design the control state accordingly.
- Connect the components to the external control hierarchy around the control state graph as necessary. To extend just the connection with changing the input/output features of the very same body with a full-fledged component.
- Alternatively, attach the control states on the outside of the drive.

These authors also observed a similar pattern in the 1990s. They demonstrated that the 1990s generation was more likely to be employed in the service sector than the 1980s generation.

Results from post-hoc analyses suggest that the combination of a low baseline CD4 count and low viral load was associated with the highest risk of death.
