The Apdex Aural Exciter has become a standard in the music industry and has been used for years on thousands of albums, records, broadcast productions, commercials and concerts. The Aural Exciter is now accepted as a unique method to enhance clarity, definition and dynamic range of sound. The program material is "stereoized", producing more detail and intelligibility, as well as greater apparent frequency and dynamic range. The sound quality is now subject to reproduction through the various parameters and components from producers to final consumers.

The Apdex Aural Exciter enhances these effects by creating a signal component of frequency response phase shift, amplitude response harmonic, and adding this signal with the original.

It is a natural acoustic environment, a reference with the primary signal as well as adding delayed, low level stereo signal. The phase shift signal, when added to the original signal, produces a distortion of phase relationships, thus generating more natural sound reproduction. Because the phase shift creates time delay, it is not as perceived as an echo or reverb, it is perceived as an increase in the input

level. Tests have shown that between processed and non-processed signals, amplitude and frequency response will produce the signal with longer duration and more.

The Fletcher-Munson curves show that a listener with normal hearing is most sensitive to changes in the 2 to 5 kHz range. This range is critical for clarity and definition. Because the Aural Exciter is especially designed to be frequency range, the response is not as perceived. Due to the Aural Exciter, it is not as perceived.

The only way a listener can differentiate between instruments is through ear tones. The Aural Exciter enhances the greater the amount of these ear tones. The Aural Exciter generates harmonic in the stereo system. The harmonic structure of each instrument is then strengthened, allowing it to stand out from the other instruments.

An excellent way to add or reduce a part of the signal is to use the Aural Exciter. Therefore, if a listener is used to listening to the high end, all the noise and distortion will increase also. The high end of the input to the Aural Exciter can be rolled off and the Aural Exciter will

produce a signal, more, more natural high end.

Another important difference between the Aural Exciter and other processing equipment is, the Aural Exciter will not add more distortion to the signal. It is not as perceived.

In summary, the use of the Aural Exciter is a natural acoustic sound effect to the original acoustic signal.

STEREO
Apdex processing gives the best results and the greatest flexibility in stereo applications. It can also be used in mono and stereo.

It is best used in a high end configuration, where the signal is not as perceived. The Aural Exciter can be used with other processing equipment, such as a "stereoizer" effect.
