BIO-333 Chapter 22 Guide 7c

1. (pgs. 1279-1281, figs. 22-1, 22-2, and 22-3) Define stem cell. How is tissue homeostasis comparable to a river? What are the defining characteristics of stem cells? Define the following terms: progenitor cell, transit-amplifying cell, terminally differentiated, multipotent, and unipotent.

**Stem Cell:** Undifferentiated cell that can continue dividing indefinitely, throwing off daughter cells that can either commit to differentiation or remain a stem cell

- This can be compared to a river because just like in a river the water looks the same flow day to day, but its downstream flow is never the same, just like in stem cells- their characteristic architecture of a self-renewing tissue is maintained even though the cell population is always changing, with differentiated cells lost "downstream", and stem cell producing new cells "upstream"

Some characteristics of stem cells include (1) they can replenish themselves as stem cells, generally throughout a lifetime- also called self-renewal. (2) they can produce differentiated cells

**Progenitor cell:** intermediate cell type that is committed to a differentiated pathway but continues to proliferate, thereby generating greater numbers of differentiated cells.

- these are also called **transit amplifying cells** because their divisions serve to amplify the number of differentiated cells that ultimately result from each stem-cell division

**Terminally differentiated:** when a cell reaches the end of its differentiation pathway and does not divide again

**Multipotent:** When a stem-cell or progenitor cell generates multiple differentiated cell types

**Unipotent:** When it generates only one differentiated cell type
