Speelman, Jack Stein, 1976 *Computability Theory and Its Applications* Peter Cholak, 2000 This collection of articles presents a snapshot of the status of computability theory at the end of the millennium and a list of fruitful directions for future research The papers represent the works of experts in the field who were invited speakers at the AMS IMS SIAM 1999 Summer Conference on Computability Theory and Applications which focused on open problems in computability theory and on some related areas in which the ideas methods and or results of computability theory play a role Some presentations are narrowly focused others cover a wider area Topics included from pure computability theory are the computably enumerable degrees M Lerman the computably enumerable sets P Cholak R Soare definability issues in the Σ_1^1 and Turing degrees A Nies R Shore and other degree structures M Arslanov S Badaev and S Goncharov P Odifreddi A Sorbi The topics involving relations between computability and other areas of logic and mathematics are reverse mathematics and proof theory D Cenzer and C Jockusch C Chong and Y Yang H Friedman and S Simpson set theory R Dougherty and A Kechris M Groszek T Slaman and computable mathematics and model theory K Ambos Spies and A Kucera R Downey and J Remmel S Goncharov and B Khoussainov J Knight M Peretyatkin A Shlapentokh **Boolean Algebra and Its Applications** H. Graham Flegg, 1964 **Automata Theory and its Applications** Bakhadyr Khoussainov, Anil Nerode, 2012-12-06 The theory of finite automata on finite strings infinite strings and trees has had a distinguished history First automata were introduced to represent idealized switching circuits augmented by unit delays This was the period of Shannon McCulloch and Pitts and Howard Aiken ending about 1950 Then in the 1950s there was the work of Kleene on representable events of Myhill and Nerode on finite coset congruence relations on strings of Rabin and Scott on power set automata In the 1960s there was the

work of Büchi on automata on infinite strings and the second order theory of one successor then Rabin's 1968 result on automata on infinite trees and the second order theory of two successors The latter was a mystery until the introduction of forgetful determinacy games by Gurevich and Harrington in 1982 Each of these developments has successful and prospective applications in computer science They should all be part of every computer scientist's toolbox Suppose that we take a computer scientist's point of view One can think of finite automata as the mathematical representation of programs that run using fixed finite resources Then Büchi's SIS can be thought of as a theory of programs which run forever like operating systems or banking systems and are deterministic Finally Rabin's S2S is a theory of programs which run forever and are nondeterministic Indeed many questions of verification can be decided in the decidable theories of these automata
