Algorithm Engineering Matthias Müller-Hannemann, Stefan

Schirra, 2010-08-05 Algorithms are essential building blocks of computer applications. However, advancements in computer hardware which render traditional computer models more and more unrealistic and an ever increasing demand for efficient solution to actual real world problems have led to a rising gap between classical algorithm theory and algorithmics in practice. The emerging discipline of Algorithm Engineering aims at bridging this gap. Driven by concrete applications, Algorithm Engineering complements theory by the benefits of experimentation and puts equal emphasis on all aspects arising during a cyclic solution process ranging from realistic modeling, design, analysis, robust and efficient implementations to careful experiments. This tutorial outcome of a GI Dagstuhl Seminar held in Dagstuhl Castle in September 2006 covers the essential aspects of this process in ten chapters on basic ideas, modeling and design issues, analysis of algorithms, realistic computer models, implementation aspects and algorithmic software libraries, selected case studies as well as challenges in Algorithm Engineering. Both researchers and practitioners in the field will find it useful as a state of the art survey.

Algorithms and Applications for Academic Search, Recommendation and Quantitative Association Rule Mining Emmanouil Amolochitis, 2022-09-01 Algorithms and Applications for Academic Search Recommendation and Quantitative Association Rule Mining presents novel algorithms for academic search recommendation and association rule mining that have been developed and optimized for different commercial as well as academic purpose systems Along with the design and implementation of algorithms a major part of the work presented in the book involves the development of new systems both for commercial as well as for academic use In the first part of the book the author introduces a novel hierarchical heuristic scheme for re ranking academic publications retrieved from standard digital libraries The scheme is based on the hierarchical combination of a custom implementation of the term frequency heuristic a time depreciated citation score and a graph theoretic computed score that relates the paper s index terms with each other In order to evaluate the performance of the introduced algorithms a meta search engine has been designed and developed that submits user queries to standard digital repositories of academic publications and re ranks the top n results using the introduced hierarchical heuristic scheme In the second part of the book the design of novel recommendation algorithms with application in different types of e commerce systems are described The newly introduced algorithms are a part of a developed Movie Recommendation system the first such system to be commercially deployed in Greece by a major Triple Play services provider The initial version of the system uses a novel hybrid recommender user item and content based and provides daily recommendations to all active subscribers of the provider currently more than 30 000 The recommenders that we are presenting are hybrid by nature using an ensemble configuration of different content user as well as item based recommenders in order to provide more accurate recommendation results The final part of the book presents the design of a quantitative association rule mining algorithm Quantitative association rules refer to a special type of association rules of the form that antecedent implies consequent consisting of a set of numerical or quantitative attributes The introduced mining algorithm processes a specific number of user histories in order to generate a set of association rules with a minimally required support and confidence value The generated rules show strong relationships that exist between the consequent and the antecedent of each rule representing different items that have been consumed at specific price levels This research book will be of appeal to researchers graduate students professionals engineers and computer programmers

Distributed Network Systems Weijia Jia, Wanlei Zhou, 2006-06-14 Both authors have taught the course of Distributed Systems for many years in the respective schools During the teaching we feel strongly that Distributed systems have evolved from traditional LAN based distributed systems towards Internet based systems Although there exist many excellent textbooks on this topic

because of the fast development of distributed systems and network programming protocols we have difficulty in finding an appropriate textbook for the course of distributed systems with orientation to the requirement of the undergraduate level study for today's distributed technology. Specifically from to date concepts, algorithms and models to implementations for both distributed system designs and application programming. Thus the philosophy behind this book is to integrate the concepts, algorithm designs and implementations of distributed systems based on network programming. After using several materials of other textbooks and research books we found that many texts treat the distributed systems with separation of concepts, algorithm design and network programming and it is very difficult for students to map the concepts of distributed systems to the algorithm design, prototyping and implementations. This book intends to enable readers especially postgraduates and senior undergraduate level to study up to date concepts, algorithms and network programming skills for building modern distributed systems. It enables students not only to master the concepts of distributed network system but also to readily use the material introduced into implementation practices.
