Paulson, 2008-11-23 influence on the conclusions that result A very conservative statistic requires very strong proof to demonstrate significant differences whereas a liberal one requires less Yuck you say already I just want to know the answer To this I respond when in doubt use a conventional statistical method one that can be agreed on and accepted by most authorities These conventional kinds of methods will be presented in this book As you gain experience choosing statistical methods will become almost an intuitive process For example for problems in which you have little experience you will be very cautious and conservative By analogy this is similar to rafting a river for the first time If you see rapids in the river you will be more conservative as you approach them wearing a life jacket and helmet and using your paddle to avoid rocks at least until you have experienced them and developed confidence You will tend to be more liberal when near a sandy shore in clear calm shallow water For experiments in microbiology in which you have much experience your microbiological knowledge enables you to be more statistically liberal as you will know whether the result of statistical analysis is microbiologically rational Finally statistics is not an end all to finding answers It is an aid in research quality control or diagnostic processes to support critical thinking and decision
