Algorithms For Computer Algebra:

Algorithms for Computer Algebra Keith O. Geddes, Stephen R. Czapor, George Labahn, 1992-09-30 Algorithms for Computer Algebra is the first comprehensive textbook to be published on the topic of computational symbolic mathematics. The book first develops the foundational material from modern algebra that is required for subsequent topics. It then presents a thorough development of modern computational algorithms for such problems as multivariate polynomial arithmetic and greatest common divisor calculations, factorization of multivariate polynomials, symbolic solution of linear and polynomial systems of equations, and analytic integration of elementary functions. Numerous examples are integrated into the text as an aid to understanding the mathematical development. The algorithms developed for each topic are presented in a Pascal-like computer language. An extensive set of exercises is presented at the end of each chapter. Algorithms for Computer Algebra is suitable for use as a textbook for a course on algebraic algorithms at the third year, fourth year, or graduate level. Although the mathematical development uses concepts from modern algebra, the book is self-contained in the sense that a one-term undergraduate course introducing students to rings and fields is the only prerequisite assumed. The book also serves well as a supplementary textbook for a traditional modern algebra course by presenting concrete applications to motivate the understanding of the theory of rings and fields. **Computer Algebra and Symbolic Computation** Joel S.

Cohen, 2002-07-19 This book provides a systematic approach for the algorithmic formulation and implementation of mathematical operations in computer algebra programming languages. The viewpoint is that mathematical expressions represented by expression trees are the data objects of computer algebra programs, and by using a few primitive operations that analyze and **Computer Algebra** R. Albrecht, B. Buchberger, G.E. Collins, R. Loos, 2012-12-06 this gap. In sixteen survey articles, the most important theoretical results, algorithms, and software methods of computer algebra are covered together with systematic references to literature. In addition, some new results are presented. Thus, the volume should be a valuable source for obtaining a first impression of computer algebra as well as for preparing a computer algebra course or for complementary reading. The preparation of some papers contained in this volume has been supported by grants from the Austrian Fonds zur Förderung der wissenschaftlichen Forschung, Project No. 3877, the Austrian Ministry of Science and Research, Department 12, Dr. S. Hollinger, the United States National Science Foundation Grant MCS 8009357, and the Deutsche Forschungsgemeinschaft Lo 23/1-2. The work on the volume was greatly facilitated by the opportunity for the editors to stay as visitors at the Department of Computer and Information Sciences, University of Delaware, at the General Electric Company Research and Development Center, Schenectady, N.Y., and at the Mathematical Sciences Department, Rensselaer Polytechnic Institute, Troy, N.Y., respectively. Our thanks go to all these institutions. The patient and experienced guidance and collaboration of the Springer Verlag, Wien, during all the stages of production are warmly appreciated.  For several years now I have been teaching courses in computer algebra at the Universitat Linz the University of Delaware
 and the Universidad de Alcala de Henares In the summers of 1990 and 1992 I have organized and taught summer schools in
 computer algebra at the Universitat Linz Gradually a set of course notes has emerged from these activities People have asked
 me for copies of the course notes and different versions of them have been circulating for a few years Finally I decided that I
 should really take the time to write the material up in a coherent way and make a book out of it Here now is the result of this
 work Over the years many students have been helpful in improving the quality of the notes and also several colleagues at
 Linz and elsewhere have contributed to it I want to thank them all for their effort in particular I want to thank B Buchberger
 who taught me the theory of Gr bner bases nearly two decades ago B F Caviness and B D Saunders who first stimulated my
 interest in various problems in computer algebra G E Collins who showed me how to compute in algebraic domains and J R
 Sendra with whom I started to apply computer algebra methods to problems in algebraic geometry Several colleagues have
 suggested improvements in earlier versions of this book However I want to make it clear that I am responsible for all

 Research School Euler Institute for Discrete Mathematics and its Applications The idea of the courses was to acquaint young
 mathematicians with algorithms and software for mathematical research and to enable them to incorporate algorithms in
 their research A collection of lecture notes was used at these courses When discussing these courses in comparison with
 other kinds of courses one might give in a week s time Joachim Neub ser referred to our courses as tapas This denomination
 underlined that the courses consisted of appetizers for various parts of algorithmic algebra indeed we covered such spicy
 topics as the link between Gr bner bases and integer programming and the detection of algebraic solutions to differential
 equations As a collection the notes turned out to have some appeal of their own which is the main reason why the idea came
 up of transforming them into book form We felt however that the book should be distinguishable from a standard text book
