Differential and Differential-Algebraic Systems for the Chemical Engineer Guido Buzzì-Ferraris, Flavio Manenti, 2015-01-12 Engineers and other applied scientists are frequently faced with models of complex systems for which no rigorous mathematical solution can be calculated To predict and calculate the behaviour of such systems numerical approximations are frequently used either based on measurements of real life systems or on the behaviour of simpler models This is essential work for example for the process engineer implementing simulation control and optimization of chemical processes for design and operational purposes This fourth in a suite of five practical guides is an engineer's companion to using numerical methods for the solution of complex mathematical problems It explains the theory behind current numerical methods and shows in a step by step fashion how to use them The volume focuses on differential and differential algebraic systems providing numerous real life industrial case studies to illustrate this complex topic It describes the methods innovative techniques and strategies that are all implemented in a freely available toolbox called BzzMath which is developed and maintained by the authors and provides up to date software tools for all the methods described in the book Numerous examples sample codes programs and applications are taken from a wide range of scientific and engineering fields such as chemical engineering electrical engineering physics medicine and environmental science As a result engineers and scientists learn how to optimize processes even before entering the laboratory With additional online material including the latest version of BzzMath Library installation tutorial all examples and sample codes used in the book and a host of further examples
