The Development of Propulsion Technology for U.S. Space-Launch Vehicles, 1926-1991 J. D. Hunley, 2013-03-15 In this definitive study J D Hunley traces the

program's development from Goddard's early rockets and the German V 2 missile through the Titan IVA and the Space Shuttle with a focus on space launch vehicles. Since these rockets often evolved from early missiles, he pays considerable attention to missile technology not as an end in itself but as a contributor to launch vehicle technology. Focusing especially on the engineering culture of the program, Hunley communicates this very human side of technological development by means of anecdotes, character sketches, and case studies of problems faced by rocket engineers. He shows how such a highly adaptive approach enabled the evolution of a hugely complicated technology that was impressive but decidedly not rocket science. Unique in its single volume coverage of the evolution of launch vehicle technology from 1926 to 1991, this meticulously researched work will inform scholars and engineers interested in the history of technology and innovation as well as those specializing in the history of space flight.

International Reference Guide to Space Launch Systems, 1999 Information, Communication, and Space Technology Mohammad Razani, 2017-12-19 Many books have covered the rapidly evolving fields of information and communication technology (ICT) and space technology separately. However, no single book has ever focused on how the integration of these two areas is creating a stronger platform for various scientific advancements, including some research work that cannot be performed on Earth. To fill the void, *Information, Communication, and Space Technology* provides a novel illustration of that connection. Dividing content into sections that cover ICT, existing and future space technologies, and satellites, the author demonstrates the individual and combined power of each of these parts of the overall system. He explores how the combination of concepts from each of these interrelated fields is creating massive potential for broader advances in areas such as robotics, communications, navigation,

agriculture health care and nanotechnology The book introduces particular potential innovations including rocket less spacecraft launches and development of a global system to balance energy distribution by using satellites that would collect solar energy and transmit it via microwave beams to different locations around the world Equally useful to students and professionals this work is a culmination of the domestic and international experience that the author has acquired throughout more than three decades as an instructor and researcher Emphasizing the strong need to incorporate ICT and space technology into the general university curriculum the book starts with basic explanations of key concepts and theories building toward more concrete application oriented examples that reveal the importance and impact of new technologies This includes coverage of how satellites transfer voice video and other data across continents as well as techniques used to obtain very high resolution images from space for use in agricultural and environmental sciences This timely work employs a logical practically structured approach that will help readers to better understand existing and emerging ICT and space technologies including the most recent developments and achievements in the field **NASA SP-7500** United States. National Aeronautics and Space Administration,1975 **Management** ,1975
