Advanced Complex Analysis Barry Simon, 2015-11-02 A

Comprehensive Course in Analysis by Poincar Prize winner Barry Simon is a five volume set that can serve as a graduate level analysis textbook with a lot of additional bonus information including hundreds of problems and numerous notes that extend the text and provide important historical background Depth and breadth of exposition make this set a valuable reference source for almost all areas of classical analysis Part 2B provides a comprehensive look at a number of subjects of complex analysis not included in Part 2A Presented in this volume are the theory of conformal metrics including the Poincar metric the Ahlfors Robinson proof of Picard s theorem and Bell s proof of the Painlevé smoothness theorem topics in analytic number theory including Jacobi s two and four square theorems the Dirichlet prime progression theorem the prime number theorem and the Hardy Littlewood asymptotics for the number of partitions the theory of Fuchsian differential equations asymptotic methods including Euler s method stationary phase the saddle point method and the WKB method univalent functions including an introduction to SLE and Nevanlinna theory The chapters on Fuchsian differential equations and on asymptotic methods can be viewed as a minicourse on the theory of special functions

Introduction to Complex

Analysis Michael E. Taylor, 2019-10-18 In this text the reader will learn that all the basic functions that arise in calculus such as powers and fractional powers exponentials and logs trigonometric functions and their inverses as well as many new functions that the reader will meet are naturally defined for complex arguments Furthermore this expanded setting leads to a much richer understanding of such functions than one could glean by merely considering them in the real domain For example understanding the exponential function in the complex domain via its differential equation provides a clean path to Euler s formula and hence to a self contained treatment of the trigonometric functions Complex analysis developed in partnership with Fourier analysis differential equations and geometrical techniques leads to the development of a cornucopia of functions of use in number theory wave motion conformal mapping and other mathematical phenomena which the reader can learn about from material presented here This book could serve for either a one semester course or a two semester course in complex analysis for beginning graduate students or for well prepared undergraduates whose background includes multivariable calculus linear algebra and advanced calculus

A First Course in Spectral Theory Milivoje Lukić, 2023-01-04 The central topic of this book is the spectral theory of bounded and unbounded self adjoint operators on Hilbert spaces After introducing the necessary prerequisites in measure theory and functional analysis the exposition focuses on operator theory and especially the structure of self adjoint operators These can be viewed as infinite dimensional analogues of Hermitian matrices the infinite dimensional setting leads to a richer theory which goes beyond eigenvalues and eigenvectors and studies self adjoint operators in the language of spectral measures and the Borel functional calculus The main approach to spectral theory adopted in the book is to present it as the

interplay between three main classes of objects self adjoint operators their spectral measures and Herglotz functions which are complex analytic functions mapping the upper half plane to itself Self adjoint operators include many important classes of recurrence and differential operators the later part of this book is dedicated to two of the most studied classes Jacobi operators and one dimensional Schrödinger operators This text is intended as a course textbook or for independent reading for graduate students and advanced undergraduates Prerequisites are linear algebra a first course in analysis including metric spaces and for parts of the book basic complex analysis Necessary results from measure theory and from the theory of Banach and Hilbert spaces are presented in the first three chapters of the book Each chapter concludes with a number of helpful exercises

Loewner's Theorem on Monotone Matrix Functions Barry Simon, 2019-08-29 This book provides an in depth discussion of Loewner's theorem on the characterization of matrix monotone functions The author refers to the book as a love poem one that highlights a unique mix of algebra and analysis and touches on numerous methods and results The book details many different topics from analysis operator theory and algebra such as divided differences convexity positive definiteness integral representations of function classes Pick interpolation rational approximation orthogonal polynomials continued fractions and more Most applications of Loewner's theorem involve the easy half of the theorem A great number of interesting techniques in analysis are the bases for a proof of the hard half Centered on one theorem eleven proofs are discussed both for the study of their own approach to the proof and as a starting point for discussing a variety of tools in analysis Historical background and inclusion of pictures of some of the main figures who have developed the subject adds another depth of perspective The presentation is suitable for detailed study for quick review or reference to the various methods that are presented The book is also suitable for independent study The volume will be of interest to research mathematicians physicists and graduate students working in matrix theory and approximation as well as to analysts and mathematical physicists

Picard theorem the uniformization theorem Ahlfors's function the sheaf of analytic germs and Jacobi as well as Weierstrass elliptic functions

Geometric Structures on Manifolds William M. Goldman, 2022-12-29 The theory of geometric structures on manifolds which are locally modeled on a homogeneous space of a Lie group traces back to Charles Ehresmann in the 1930s although many examples had been studied previously Such locally homogeneous geometric structures are special cases of Cartan connections where the associated curvature vanishes This theory received a big boost in the 1970s when W Thurston put his geometrization program for 3 manifolds in this context The subject of this book is more ambitious in scope Unlike Thurston's eight 3 dimensional geometries it covers structures which are not metric structures such as affine and projective structures This book describes the known examples in dimensions one two and three Each geometry has its own special features which provide special tools in its study Emphasis is given to the interrelationships between different geometries and how one kind of geometric structure induces structures modeled on a different geometry Up to now much of the literature has been somewhat inaccessible and the book collects many of the pieces into one unified work This book focuses on several successful classification problems Namely fix a geometry in the sense of Klein and a topological manifold Then the different ways of locally putting the geometry on the manifold lead to a moduli space Often the moduli space carries a rich geometry of its own reflecting the model geometry The book is self contained and accessible to students who have taken first year graduate courses in topology smooth manifolds differential geometry and Lie groups

Normal Families and Normal Functions Peter V. Dvobush, Steven G. Krantz, 2024-02-27 This book centers on normal families of holomorphic and meromorphic functions and also normal functions The authors treat one complex variable several complex variables and infinitely many complex variables i.e Hilbert space The theory of normal families is more than 100 years old It has played a seminal role in the function theory of complex variables It was used in the

first rigorous proof of the Riemann mapping theorem It is used to study automorphism groups of domains geometric analysis and partial differential equations The theory of normal families led to the idea in 1957 of normal functions as developed by Lehto and Virtanen This is the natural class of functions for treating the Lindelof principle The latter is a key idea in the boundary behavior of holomorphic functions This book treats normal families normal functions the Lindelof principle and other related ideas Both the analytic and the geometric approaches to the subject area are offered The authors include many incisive examples The book could be used as the text for a graduate research seminar It would also be useful reading for established researchers and for budding complex analysts
