Decoupling or non interactive control has attracted considerable research attention since the 1960s when control engineers started to deal with multivariable systems The theory and design techniques for decoupling control have now more or less matured for linear time invariant systems yet there is no single book which focuses on such an important topic The present monograph fills this gap by presenting a fairly comprehensive and detailed treatment of decoupling theory and relevant design methods Decoupling control under the framework of polynomial transfer function and frequency response settings is included as well as the disturbance decoupling problem The emphasis here is on special or relatively new compensation schemes such as true and virtual feedforward control and disturbance observers rather than use of feedback control alone The results are presented in a self contained way and only the knowledge of basic linear systems theory is assumed of the reader **Advanced Control Systems** Yuriy P. Kondratenko,Vsevolod M. Kuntsevich,Arkadii A. Chikrii,Vyacheslav F.

Industrial Process Identification and Control Design Tao Liu, Furong Gao, 2011-11-16. *Industrial Process Identification and Control Design* is devoted to advanced identification and control methods for the operation of continuous time processes both with and without time delay in industrial and chemical engineering practice. The simple and practical step or relay feedback test is employed when applying the proposed identification techniques which are classified in terms of common industrial process type: open loop stable, integrating and unstable respectively. Correspondingly, control system design and tuning models that follow are presented for single input single output processes. Furthermore, new two degree of freedom control strategies and cascade control system design methods are explored with reference to independently improving set point tracking and load disturbance rejection. Decoupling, multi loop and decentralized control techniques for the operation of multiple input multiple output processes are also detailed. Perfect tracking of a desired output trajectory is realized using iterative learning control in uncertain industrial batch processes. All the proposed methods are presented in an easy to follow style illustrated by examples and practical applications. This book will be valuable for researchers in system identification and control theory and will also be of interest to graduate control students from process chemical and electrical engineering backgrounds and to practising control engineers in the process industry.
