The authors review and categorize the research in applications of artificial intelligence (AI) and expert systems (ES) in new product development (NPD) activities. A brief overview of NPD process and AI is presented. This is followed by a literature survey in regard to AI and ES applications in NPD, which revealed twenty four articles (twenty two applications) in the 1990–1997 period. The applications are categorized into five areas: expert decision support systems for NPD project evaluation, knowledge-based systems (KBS) for product and process design, KBS for QFD, AI support for conceptual design and AI support for group decision making in concurrent engineering. Brief review of each application is provided. The articles are also grouped by NPD stages and seven NPD core elements (competencies and abilities). Further research areas are pointed out.

1. Introduction

Artificial intelligence (AI), as a discipline, has grown enormously during the past decade. AI applications today span the realm of manufacturing, consumer products, finance, management and medicine. Implementation of the appropriate AI technique in an application is often a must to stay competitive. Truly profitable AI techniques are often kept secret. Expert systems (ES) and knowledge-based systems (KBS) applications have been prolific, impacting many areas of decision making in industries, especially in manufacturing like scheduling, production planning, plant layout, advanced manufacturing processes, purchasing and materials.

Today's manufacturing organizations compete not only on the factory floor, but also in the product development arena (Abegglen and Stalk, 1985; Stalk, 1988; Nonaka and Takeuchi, 1995). A competitive advantage can be built through superior manufac-

turing but sustaining it over time requires skills in developing a continual stream of new products. Shorter product life cycle, more demanding customers, and globalization of market make new products not just desirable for a company, but mandatory (Kuczmarski, 1988). Not only is product development becoming more central to meeting the increasingly specialized demands of customers, it can also have a powerful impact on manufacturing productivity and quality. For example, setup times are determined not only by process design, but also by product design. 70–80% of the cost of the product is determined during the design stage. The same is true for product quality. Poor product design causes many defects on the production floor (van Dierdonck, 1990). Product development also absorbs a huge amount of money. The development of Ford Escort, Chrysler LH, and Chrysler Neon is reportedly to have cost their companies \$5 billion, \$1.5 billion and \$1.3 billion respectively.
