Hancock, 2017-11-01 Fatigue is a recognized problem in many facets of the human enterprise It is not confined to any one area of activity but enters all situations in which humans have to perform for extended intervals of time Most problematic are the circumstances in which obligatory action is continuous and the results of failure are evidently serious or even catastrophic Therefore the modern media especially highlights fatigue related failures in industries such as transportation materials processing and healthcare It can be and indeed is no coincidence that most of the spectacular failures in process control that have resulted in the world s largest industrial accidents have occurred in the small hours of the morning when the circadian rhythm is lowest and operator fatigue itself peaks While there have been legislative efforts made at state federal and international levels to regulate working hours of employees the appropriate implementation of

such legislation is still a long way off The Handbook of Operator Fatigue provides a comprehensive account of the subject to serve as the definitive reference work for researchers students and practitioners alike The volume features 30 chapters written by experts from around the world to address each important facet of fatigue including the scale of the fatigue problem Section I the nature of fatigue Section II how to assess fatigue Section III the impact of fatigue on health Section IV fatigue in the workplace Section V the neurological basis of fatigue VI sleep disorders VII and the design of countermeasures to fatigue VIII

Stability Operations have become the most prevalent mission for U S forces in the current global security environment This research explores new methods to assist in determining when it is acceptable to downsize a force in a stability operation The methodology developed provides insight into this problem by quantifying force protection risk mission failure risk and time in the context of the operational threat environment The Pythagoras Multi Agent Simulation and Data Farming techniques are used to investigate force level comparison in a theoretical threat continuum based on a peacekeeping scenario similar to the Bosnian operation The data from the simulation is to construct simple tools for decision makers These tools are used collectively to find the balance according to a commander s priorities between the conflicting issues of force protection mission success and time Two areas are identified as significant in achieving success in stability operations They are troop posturing and troop employment The problem is that they are often overlooked or under emphasized The result of this research demonstrates that posturing and employment should be considered as factors equal to force size in contributing to the goal of maximizing force presence In addition this research provides a vehicle to assist military planners with ways in which a stability force can maximize and maintain near continuous presence while simultaneously minimizing the risk to the force and adhere to operational timelines Overall the important conclusion in the significance of troop posture on force size transitions As a force is downsized it is crucial to evaluate how to maintain presence with the smaller force This is evident by the surprising success achieved by the smallest force in the simulation It was able to project a greater presence by utilizing small dispersed units much like the Combined Action Platoons in Vietnam
