Biology And Exploitation Of The Minke Whale:

Biology and Exploitation of the Minke Whale Joseph W. Horwood, 1989-12-21 This comprehensive review includes much recent research material and is the only book exclusively devoted to the minke whale species. The scope of this book focuses on three main topics. The first emphasis is on the population biology of the minke whale. Then it documents the historical and current exploitation by man. Finally it evaluates the current size status and management of the many worldwide stocks of minke whales. It also includes a description of the birth and death processes that determine how and why the minke whale population varies from time to time. This is an excellent source for specialists in the fields of cetacean biology, population biology, and management of natural resources. Presented in an interesting manner, this work is also appreciated by students and technically interested lay readers.

Marine Mammals of the World: A Comprehensive Guide to Their Identification Thomas Allen Jefferson, Marc A. Webber, Robert L. Pitman, 2011-08-29 With coverage on all the marine mammals of the world, authors Jefferson, Webber, and Pitman have created a user-friendly guide to identify marine mammals alive in nature at sea or on the beach, dead specimens in hand, and also to identify marine mammals based on features of the skull. This handy guide provides marine biologists and interested lay people with detailed descriptions of diagnostic features, illustrations of external appearance, beautiful photographs, dichotomous keys, and more. Full color illustrations and vivid photographs of every living marine mammal species are incorporated, as well as comprehensible maps showing a range of information. For readers who desire further consultation, authors have included a list of literature references at the end of each species account. For an enhanced understanding of habitation, this guide also includes recognizable geographic forms described separately with colorful paintings and photographs. All of these essential tools provided make *Marine Mammals of the World* the most detailed and authoritative guide available. Contains superb photographs of every species of marine mammal for accurate identification. Authors' collective experience adds up to 80 years and have seen nearly all of the species and distinctive geographic forms described in the guide. Provides the most detailed and anatomically accurate illustrations currently available. Special emphasis is placed on the identification of species in problem groups such as the beaked whales, long beaked oceanic dolphin, and southern fur seals. Includes a detailed list of sources for more information at the back of the book.

Quantitative Methods for Conservation Biology Scott Ferson, Mark Burgman, 2006-05-09 Quantitative methods are needed in conservation biology more than ever as an increasing number of threatened species find their way onto international and national red lists. Objective evaluation of population decline and extinction probability are required for sound decision making. Yet as our colleague Selina Heppell points out, population viability analysis and other forms of formal risk assessment are underused in policy formation because of data uncertainty and a lack of standardized methodologies and unambiguous criteria, i.e. rules of thumb. Models used in conservation biology range from those that are purely heuristic to some that are highly predictive. Model selection should be dependent on the questions being asked and the data that are

available We need to develop a toolbox of quantitative methods that can help scientists and managers with a wide range of systems and that are subject to varying levels of data uncertainty and environmental variability The methods outlined in the following chapters represent many of the tools needed to fill that toolbox When used in conjunction with adaptive management they should provide information for improved monitoring risk assessment and evaluation of management alternatives The first two chapters describe the application of methods for detecting trends and extinctions from sighting data Presence absence data are used in general linear and additive models in Chapters 3 and 4 to predict the extinction proneness of birds and to build habitat models for plants

Cook Inlet Planning Area Oil and Gas Lease Sales 191 and 199 ,2002 **"New" POPs in Marine Mammals in Nordic Arctic and NE Atlantic Areas During Three Decades** Maria Dam, 2011 Marine mammals hold a special position in the hearts of people inhabiting Nordic Arctic areas and in coastal communities around the North

Atlantic Ocean as they are an essential part of the diet and traditional life style. However, marine mammals are in a particularly vulnerable position as regards environmental pollutants because of the large fat stores in their bodies which serve as a magnet to a large number of persistent and toxic pollutants. A Nordic Council of Ministers supported collaboration between Norway, Denmark, Greenland, Faroe Island, Iceland, and Sweden set out to look for possible trends in new contaminants in marine mammals in Nordic Arctic waters. The new contaminants in focus are the brominated flame retardants including the PBDEs, methoxylated PBDEs, perfluorinated compounds including the PFOS family, and polychlorinated naphthalenes. In addition, a subset of the samples was analysed for brominated dioxins and dibenzofurans. The marine mammals studied were fin whale, minke whale, pilot whale, white-sided dolphins, harbour porpoise, ringed seal, and hooded seal. The study aims at giving a wide scope of the presence of these new contaminants in marine mammals in recent time and going back to the 1980s using samples from specimen banks.
