Basic Complex Analysis Barry Simon, 2015-11-02 A Comprehensive Course in Analysis by Poincar Prize winner Barry Simon is a five volume set that can serve as a graduate level analysis textbook with a lot of additional bonus information including hundreds of problems and numerous notes that extend the text and provide important historical background Depth and breadth of exposition make this set a valuable reference source for almost all areas of classical analysis Part 2A is devoted to basic complex analysis It interweaves three analytic threads associated with Cauchy Riemann and Weierstrass respectively Cauchy s view focuses on the differential and integral calculus of functions of a complex variable with the key topics being the Cauchy integral formula and contour integration For Riemann the geometry of the complex plane is central with key topics being fractional linear transformations and conformal mapping For Weierstrass the power series is king with key topics being spaces of analytic functions the product formulas of Weierstrass and Hadamard and the Weierstrass theory of elliptic functions Subjects in this volume that are often missing in other texts include the Cauchy integral theorem when the contour is the boundary of a Jordan region continued fractions two proofs of the big Picard theorem the uniformization theorem Ahlfors s function the sheaf of analytic germs and Jacobi as well as Weierstrass elliptic functions

[Introduction to Complex Analysis](#) Michael E. Taylor, 2019-10-18 In this text the reader will learn that all the basic functions that arise in calculus such as powers and fractional powers exponentials and logs trigonometric functions and their inverses as well as many new functions that the reader will meet are naturally defined for complex arguments Furthermore this expanded setting leads to a much richer

understanding of such functions than one could glean by merely considering them in the real domain For example understanding the exponential function in the complex domain via its differential equation provides a clean path to Euler's formula and hence to a self contained treatment of the trigonometric functions Complex analysis developed in partnership with Fourier analysis differential equations and geometrical techniques leads to the development of a cornucopia of functions of use in number theory wave motion conformal mapping and other mathematical phenomena which the reader can learn about from material presented here This book could serve for either a one semester course or a two semester course in complex analysis for beginning graduate students or for well prepared undergraduates whose background includes multivariable calculus linear algebra and advanced calculus

Linear and Nonlinear Functional Analysis with Applications, Second Edition Philippe G. Ciarlet, 2025-04-23 This new considerably expanded edition covers the fundamentals of linear and nonlinear functional analysis including distribution theory harmonic analysis differential geometry calculus of variations and degree theory Numerous applications are included especially to linear and nonlinear partial differential equations and to numerical analysis All the basic theorems are provided with complete and detailed proofs The author has added more than 450 pages of new material added more than 210 problems the solutions to all of the problems will be made available on an accompanying website added two entirely new chapters one on locally convex spaces and distribution theory and the other on the Fourier transform and Calderón Zygmund singular integral operators and enlarged and split the chapter on the great theorems of nonlinear functional analysis into two chapters one on the calculus of variations and the other on Brouwer's theorem Brouwer's degree and Leray Schauder's degree Ideal for both teaching and self study Linear and Nonlinear Functional Analysis with Applications Second Edition is intended for advanced undergraduate and graduate students in mathematics university professors and researchers It is also an ideal basis for several courses on linear or nonlinear functional analysis

A First Course in Spectral Theory Milivoje Lukić, 2023-01-04 The central topic of this book is the spectral theory of bounded and unbounded self adjoint operators on Hilbert spaces After introducing the necessary prerequisites in measure theory and functional analysis the exposition focuses on operator theory and especially the structure of self adjoint operators These can be viewed as infinite dimensional analogues of Hermitian matrices the infinite dimensional setting leads to a richer theory which goes beyond eigenvalues and eigenvectors and studies self adjoint operators in the language of spectral measures and the Borel functional calculus The main approach to spectral theory adopted in the book is to present it as the interplay between three main classes of objects self adjoint operators their spectral measures and Herglotz functions which are complex analytic functions mapping the upper half plane to itself Self adjoint operators include many important classes of recurrence and differential operators the later part of this book is dedicated to two of the most studied classes Jacobi operators and one dimensional Schrödinger operators This text is intended as a course textbook or for independent reading for graduate students and advanced undergraduates Prerequisites

are linear algebra a first course in analysis including metric spaces and for parts of the book basic complex analysis Necessary results from measure theory and from the theory of Banach and Hilbert spaces are presented in the first three chapters of the book Each chapter concludes with a number of helpful exercises

Complex Analysis Taras

Mel'nyk,2023-10-04 Today the theory of complex valued functions finds widespread applications in various areas of mathematical research as well as in electrical and mechanical engineering aeronautics and other disciplines Complex analysis has become a basic course in mathematics physics and select engineering departments This concise textbook provides a thorough introduction to the function theory of one complex variable It presents the fundamental concepts with clarity and rigor offering concise proofs that avoid lengthy and tedious arguments commonly found in mathematics textbooks It goes beyond traditional texts by exploring less common topics including the different approaches to constructing analytic functions the conformal mapping criterion integration of analytic functions along arbitrary curves global analytic functions and their Riemann surfaces the general inverse function theorem the Lagrange B rmann formula and Puiseux series Drawing from several decades of teaching experience this book is ideally suited for one or two semester courses in complex analysis It also serves as a valuable companion for courses in topology approximation theory asymptotic analysis and functional analysis Abundant examples and exercises make it suitable for self study as well

Loewner's Theorem on Monotone Matrix Functions Barry Simon,2019-08-29 This book provides an in depth discussion of Loewner s theorem on the characterization of matrix monotone functions The author refers to the book as a love poem one that highlights a unique mix of algebra and analysis and touches on numerous methods and results The book details many different topics from analysis operator theory and algebra such as divided differences convexity positive definiteness integral representations of function classes Pick interpolation rational approximation orthogonal polynomials continued fractions and more Most applications of Loewner s theorem involve the easy half of the theorem A great number of interesting techniques in analysis are the bases for a proof of the hard half Centered on one theorem eleven proofs are discussed both for the study of their own approach to the proof and as a starting point for discussing a variety of tools in analysis Historical background and inclusion of pictures of some of the main figures who have developed the subject adds another depth of perspective The presentation is suitable for detailed study for quick review or reference to the various methods that are presented The book is also suitable for independent study The volume will be of interest to research mathematicians physicists and graduate students working in matrix theory and approximation as well as to analysts and mathematical physicists

Geometric Structures on Manifolds William M.

Goldman,2022-12-20 The theory of geometric structures on manifolds which are locally modeled on a homogeneous space of a Lie group traces back to Charles Ehresmann in the 1930s although many examples had been studied previously Such locally homogeneous geometric structures are special cases of Cartan connections where the associated curvature vanishes This theory received a big boost in the 1970s when W Thurston put his geometrization program for 3 manifolds in this

context The subject of this book is more ambitious in scope Unlike Thurston's eight 3 dimensional geometries it covers structures which are not metric structures such as affine and projective structures This book describes the known examples in dimensions one two and three Each geometry has its own special features which provide special tools in its study Emphasis is given to the interrelationships between different geometries and how one kind of geometric structure induces structures modeled on a different geometry Up to now much of the literature has been somewhat inaccessible and the book collects many of the pieces into one unified work This book focuses on several successful classification problems Namely fix a geometry in the sense of Klein and a topological manifold Then the different ways of locally putting the geometry on the manifold lead to a moduli space Often the moduli space carries a rich geometry of its own reflecting the model geometry The book is self contained and accessible to students who have taken first year graduate courses in topology smooth manifolds differential geometry and Lie groups
