Autonomous Robots Autonomous Robots:

Autonomous Robots George A. Bekey, 2005-05-20 An introduction to the science and practice of autonomous robots that reviews over 300 current systems and examines the underlying technology Autonomous robots are intelligent machines capable of performing tasks in the world by themselves without explicit human control Examples range from autonomous helicopters to Roomba the robot vacuum cleaner In this book George Bekey offers an introduction to the science and practice of autonomous robots that can be used both in the classroom and as a reference for industry professionals He surveys the hardware implementations of more than 300 current systems reviews some of their application areas and examines the underlying technology including control architectures learning manipulation grasping navigation and mapping Living systems can be considered the prototypes of autonomous systems and Bekey explores the biological inspiration that forms the basis of many recent developments in robotics He also discusses robot control issues and the design of control architectures After an overview of the field that introduces some of its fundamental concepts the book presents background material on hardware control from both biological and engineering perspectives software architecture and robot intelligence It then examines a broad range of implementations and applications including locomotion wheeled legged flying swimming and crawling robots manipulation both arms and hands localization navigation and mapping The many case studies and specific applications include robots built for research industry and the military among them underwater robotic vehicles walking machines with four six and eight legs and the famous humanoid robots Cog Kismet ASIMO and QRIO The book concludes with reflections on the future of robotics the potential benefits as well as the possible dangers that may arise from large numbers of increasingly intelligent and autonomous robots

Autonomous Robots Farbod Fahimi,2008-10-25 It is at least two decades since the conventional robotic manipulators have become a common manufacturing tool for different industries from automotive to pharmaceutical The proven benefits of utilizing robotic manipulators for manufacturing in different industries motivated scientists and researchers to try to extend the applications of robots to many other areas by inventing several new types of robots other than conventional manipulators The new types of robots can be categorized in two groups redundant and hyper redundant manipulators and mobile ground marine and aerial robots These groups of robots known as advanced robots have more freedom for their mobility which allows them to do tasks that the conventional manipulators cannot do Engineers have taken advantage of the extra mobility of the advanced robots to make them work in constrained environments ranging from limited joint motions for redundant or hyper redundant manipulators to obstacles in the way of mobile ground marine and aerial robots Since these constraints usually depend on the work environment they are variable Engineers have had to invent methods to allow the robots to deal with a variety of constraints automatically A robot that is equipped with those methods is called an Autonomous Robot Autonomous Robots Kinematics Path Planning and Control covers the kinematics and dynamic modeling analysis of Autonomous Robots as well as the methods suitable for their control The text is suitable for mechanical and electrical engineers who want to familiarize themselves with methods of modeling analysis control that have been proven efficient through research

Plan-Based Control of Robotic Agents Michael Beetz,2002-12-13 Robotic agents such as autonomous office couriers or robot tourguides must be both reliable and efficient Thus they have to flexibly interleave their tasks exploit opportunities quickly plan their course of action and if necessary revise their intended activities This book makes three major contributions to improving the capabilities of robotic agents first a plan representation method is introduced which allows for specifying flexible and reliable behavior second probabilistic hybrid action models are presented as a realistic causal model for predicting the behavior generated by modern concurrent percept driven robot plans third the system XFRMLEARN capable of learning structured symbolic navigation plans is described in detail

Autonomous Robots Research Advances Weihua Yang,2008 Autonomous robots are robots which can perform desired tasks in unstructured environments without continuous human guidance Many kinds of robots have some degree of autonomy Different robots can be autonomous in different ways A high degree of autonomy is particularly desirable in fields such as space exploration where communication delays and interruptions are unavoidable Some modern factory robots are autonomous within the strict

confines of their direct environment The exact orientation and position of the next object of work and in the more advanced factories even the type of object and the required task must be determined This can vary unpredictably at least from the robot s point of view One important area of robotics research is to enable the robot to cope with its environment whether this be on land underwater in the air underground or in space This book presents the latest research from around the globe
