Riggs, James Allen Wrather, 2004-01-01 **Soybean Cyst Nematode Biology and Management** Loren J. Giesler, Thomas Orin Powers, John A. Wilson, University of Nebraska--Lincoln. Cooperative Extension, 2003 Soybean cyst nematode is a serious threat in parts of Nebraska discusses symptoms and how to fight the pest **Plant-parasitic and Entomogenous Nematode Research**, 1991 **Achieving sustainable cultivation of soybeans Volume 2** Prof. Henry T. Nguyen, 2018-02-20 Detailed coverage of oomycete fungal viral and bacterial diseases affecting soybeans Reviews developments in disease and pest resistant varieties as well as integrated pest and weed management Summarises research on developing food and non food uses from improving nutritional properties to uses in animal feed and biodiesel *The Cyst Nematodes* S.B. Sharma, 2013-03-14 When Franklin published her book on cyst nematodes in 1951 the cyst nematodes were already known as serious pests of brassicas cereals potatoes and sugar beets However at that time this group of nematode with about 12 species was considered to be largely temperate in distribution Now a total of 105 species including those that are considered as synonyms or species inquirende by some or all within six genera of cyst nematodes have been described from temperate tropical and subtropical regions and at least five species are important constraints to crop production in tropical agriculture The previous impression of localization of cyst nematodes in the temperate region was seemingly an artifact due to a greater concentration of nematologists in the temperate regions Based on my own experience of working in several Asian and African countries I believe that many more undescribed species are present in the tropical countries of Asia and Africa and probably in other tropical regions Most growers extension workers and research managers in these regions are still not aware of the possible harm of presence of these nematodes in their agricultural soils The cyst nematodes are perhaps smaller than the smallest available computer chip but they are very well programmed to survive and propagate despite severe hardships These nematodes are very selective in their choice of food about 50% of known species are parasites of plants mainly in the families Poaceae and Fabaceae **Cyst Nematodes** Roland N Perry, Maurice Moens, John T Jones, 2018-04-09 This book is a compendium of current information on all aspects of these economically important parasites It provides comprehensive coverage of their biology management morphology and diagnostics in addition to up to date information on molecular aspects of taxonomy host parasitic relationships and resistance Written by a team of international

experts Cyst Nematodes will be invaluable to all researchers lecturers and students in nematology parasitology agriculture and agronomy industries with an interest in chemical and biological control products for management of plant parasitic nematodes and any courses quarantine and advisory services **Biological Control of Crop Diseases** Samuel S.

Gnanamanickam, 2002-04-03 With contributions from more than 30 internationally renowned experts this book combines coverage of theory with coverage of global practices Highlighting the day to day challenges of organic crop management for cost effective real world application the book explores the biological control of diseases in 12 major crops It focuses on the use of host plant resistance through transgenics and induced systemic resistance as a part of biological control Topics covered include the role of biocontrol agents for signalling resistance effective ecofriendly alternative to combat bacterial fungal and viral infestation and transgenic crops in disease management **Advances in Molecular Plant Nematology** F. Lamberti, C. Oe Giorgi, David McK. Bird, 2013-06-29 Plant parasitic nematodes are a main pest to crops For example the root knot nematodes belonging to the genus *Meloidogyne* are worldwide in their distribution and attack almost every type of crop causing considerable losses of yield and affecting quality of produce The cyst nematodes within the genera *Globodera* and *Heterodera* constitute a major group of plant pathogens in many countries throughout the world suppressing yields of potato sugar beet soybean and cereals Several nematodes such as longidorids and trichodorids are implicated in the transmission of numerous plant viruses Many others cause constraints to agricultural production either locally or on large areas However despite their economic importance they account for worldwide crop reduction in excess of 10% plant parasitic nematodes are still poorly understood because most of them are obligate parasites of roots Environmental concerns over the agricultural use of pesticides demand the development of alternative measures to control them To achieve environmentally sound control knowledge of the basic biology of nematodes must be expanded Important research areas include understanding the molecular bases for pathogenicity the molecular mechanisms of the host parasite interactions and the genetic bases for population fluctuations The workshop has for the first time brought together an international group of researchers using molecular approaches to study plant parasitic nematodes and their host responses **The Soybean** Guriqbal Singh, 2010 The book is divided into 6 sections 20 chapters which deal with history and importance botany genetics and plant physiology production plant protection utilization and marketing and trade of soybeans
