1. Label the following and give the functions

NAME OF PART & FUNCTION/S:

- A - Nucleic Acids (DNA)
- B - Base Plate
- C - Sheath
- D - Tail Fibers
- E - Collar
- F - Capsid
- G - Spikes

2. A bigger virus has what part that is not included above? What does this part help with?

The part that is not included is envelope. This is used for extra protection for the virus.

3. A virus that infects a bacteria is called a bacteriophage

4. List two diseases from the notes that are communicable. Why are these considered communicable?

Common Cold

Swine Flu

- Both of these are easily spread

5. Symptoms - evidence of damage to the host

Hobom, Rudolf Rott, 2012-12-06 The fact that none of the known DNA polymerases is able to initiate DNA chains but only to elongate from a free 3' OH group raises

the problem of how replication is initiated both at the replication origin and on Okazaki fragments. It was first shown by A. Kornberg et al. that a general mechanism to initiate replication is through the formation of an RNA primer catalyzed by RNA polymerases or by a new class of enzymes, the primases (Kornberg 1980). This mechanism, which can be used in the case of circular DNA molecules or linear DNAs that circularize or form concatemers, cannot be used at the ends of linear DNAs since the RNA primer is removed from the DNA chain and there is no way of filling the gap resulting at the 5' ends of the newly synthesized DNA chain. In some cases, linear DNA molecules contain a palindromic nucleotide sequence at the 3' end that allows the formation of a hairpin structure which provides the needed free 3' OH group for elongation. This mechanism, first proposed by Cavalier-Smith (1974) for eukaryotic DNA replication, was shown to take place in several systems (Kornberg 1980, 1982). Another mechanism to initiate replication consists in the specific nicking of one of the strands of a circular double-stranded DNA, producing a 3' OH group available for elongation (Kornberg 1980).

Molecular Genetics Pt 2 Herbert Taylor, 2012-12-02. Molecular Genetics Part II covers the significant developments in various areas of molecular genetics. This book is composed of 10 chapters that also consider the gene expression and regulation of some enzymes. The opening chapters deal with the mechanisms of nucleic acid replication and repair as well as the structural aspects of the genetic apparatus of viruses and cells. The next chapters explore the patterns and mechanisms of genetic recombination, the in vitro and in vivo experiments to delineate the genetic code and the initiation of peptide chains in *Escherichia coli*. These topics are followed by discussions of the mechanism of DNA-dependent RNA synthesis, the regulation of enzyme synthesis in microorganisms, and the regulation of viral replication. The final chapters consider the theoretical and practical aspects of the metabolic regulation in the metazoan system and the procedures for the study of DNA-DNA and DNA-RNA interactions. This book will be of great value to molecular geneticists, biochemists, and researchers.
