Progress in Motor Control Jozsef Laczko, Mark L. Latash, 2016-12-30. This single volume brings together both theoretical developments in the field of motor control and their translation into such fields as movement disorders, motor rehabilitation, robotics, prosthetics, brain machine interface and skill learning. Motor control has established itself as an area of scientific research characterized by a multi disciplinary approach. Its goal is to promote cooperation and mutual understanding among researchers addressing different aspects of the complex phenomenon of motor coordination. Topics covered include recent theoretical advances from various fields: the neurophysiology of complex natural movements, the equilibrium point hypothesis, motor learning of skilled behaviors, the effects of age, brain injury or systemic disorders such as Parkinson's Disease and brain computer interfaces. The chapter 'Encoding Temporal Features of Skilled Movements: What, Whether and How' is available open access under a CC BY 4.0 license via [link.springer.com](https://www.springer.com). **Seminars in Motor Control** Mark L. Latash, 2025. Mark L. Latash approaches motor control as a biological discipline that requires the language of laws of nature, sets of adequate concepts specific for biological movement and exploration using the scientific method developed in natural science. *Seminars in Motor Control* introduces and develops the theory of the parametric control of movement with spatial referent coordinates, a generalization of the equilibrium point hypothesis which is naturally compatible with the principle of abundance and the uncontrolled manifold hypothesis. The chapters discuss potential neurophysiological mechanisms involved in ensuring stability of functional movements and the relations among movement stability, agility and optimality. The author addresses issues such as posture movement paradox, equifinality and its violations, motor equivalence, muscle coactivation, multi muscle and intra muscle synergies, unintentional drifts in performance, kinesthetic perception changes in movements with fatigue, aging, motor learning, neurological disorders and rehabilitation. Consisting of five parts, *Seminars in Motor Control* examines current research in a clear and accessible style, ideal for graduate students, postdoctoral fellows and faculty in such departments as kinesiology, neuroscience, physiology, psychology and physical therapy.
