Biosilica in Evolution, Morphogenesis, and Nanobiotechnology Werner E. G. Müller, Mikhael A.

Grachev, 2009-02-07 Lake Baikal is the oldest deepest and most voluminous lake on Earth comprising one fifth of the World's unfrozen fresh water. It hosts the highest number of endemic animals recorded in any freshwater lake. Until recently it remained enigmatic why such a high diversity evolved in the isolated Lake Baikal. Focusing on the sponges phylum Porifera as an example, some answers are provided to fundamental questions on evolutionary forces. The characteristic feature of these animals is that they form their polymeric silicic acid skeleton enzymatically. This process is explored using modern molecular biological and cellular biological techniques to outline strategies to fabricate novel materials applicable in biomedicine and nanooptics.

Functional Marine Biomaterials Se-Kwon Kim, 2015-06-29 Functional Marine Biomaterials Properties and Applications provides readers with the latest information on the diverse marine environment as a resource for many new substances including biopolymers, bioceramics, and biominerals. As recent advances and funding have enabled scientists to begin harnessing many of these materials for biomedical applications from drug delivery to bone tissue engineering and biosensors, this important new text provides readers with a comprehensive review of these materials and their functional applications in the biomedical field. Chapters discuss the properties of the main classes of functional marine biomaterials, applications of marine products in tissue engineering, applications in drug delivery systems, and the role of marine derived materials in medical devices. Centromere Durdica Ugarkovic, 2009-06-12 The centromere is a chromosomal region that enables the accurate segregation of chromosomes during mitosis and meiosis It holds sister chromatids together and through its centromere DNA protein complex known as the kinetochore binds spindle microtubules to bring about accurate chromosome movements Despite this conserved function centromeres exhibit dramatic difference in structure size and complexity Extensive studies on centromeric DNA revealed its rapid evolution resulting often in significant difference even among closely related species Such a plasticity of centromeric DNA could be explained by epigenetic control of centromere function which does not depend absolutely on primary DNA sequence According to epigenetic centromere concept which is thoroughly discussed by Tanya Panchenko and Ben Black in Chap 1 of this book centromere activation or inactivation might be caused by modifications of chromatin Such acquired chromatin epigenetic modifications are then inherited from one cell

di sion to the next Concerning centromere specific chromatin modification it is now evident that all centromeres contain a centromere specific histone H3 variant CenH3 which replaces histone H3 in centromeric nucleosomes and provides a structural basis that epigenetically defines centromere and differentiates it from the surrounding chromatin Recent insights into the CenH3 presented in this chapter add important mechanistic understanding of how centromere identity is initially established and subsequently maintained in every cell cycle
