

## Copy Design

The Copy Design feature has been completely redesigned, enabling new user-requested workflows and productivity enhancements, including reference-based copy, property and file behavior management, automatic file numbering, and performance improvements.

### Multiple file copy

The new copy design tool enables greater productivity by now permitting users to copy more than one set of files per operation. Add multiple assemblies or individual files and configure them independently to execute multiple copy operations at one time.

### Reference-based copy

In operations where the same component is referenced by multiple assemblies, you can now configure different operations for each reference in the model context. Traditionally, when a component is used in more than one location, such as derived parts in skeletal models, it is copied in all other assembly levels, making it impossible to replace or reuse instances where required.

By selecting the reference option, each individual component reference can have its copy behavior set independently.

### Copy Design reference support

Changes to reference management means you are now also able to copy models containing circular references, such as derived parts or Autodesk® AutoCAD® overlays, as well as non-CAD file types, including attachments.

### Replace with pending files

A new feature for use with skeletal modeling techniques is the ability to replace components with pending data. This means that files that will be created as part of the copy process can be reused throughout the structure.

When selecting Replace on a component, a Pending Data option appears in the file dialog—here you have access to the uncommitted new files being created by copy operations elsewhere in the model.

Once referenced into the operation, Vault will create the new file and rebuild the new structure with the selected file, like it would with any normal replace operation.

### Folder-based Copy Design

Based on user feedback, the new Copy Design interface enables you to execute copy operations based on folder location. After selecting your data, you can create new folders, carry out file operations based on the folder location, drag and drop between folders, and use a visual method for configuring the copy.
