Biosecurity Of Select Agents And Toxins:

Responsible Research with Biological Select Agents and Toxins National Research Council, Division on Earth and Life Studies, Board on Life Sciences, Committee on Laboratory Security and Personnel Reliability Assurance Systems for Laboratories Conducting Research on Biological Select Agents and Toxins, 2010-01-12 The effort to understand and combat infectious diseases has during the centuries produced many key advances in science and medicine including the development of vaccines drugs and other treatments A subset of this research is conducted with agents that like anthrax not only pose a severe threat to the health of humans plants and animals but can also be used for ill intended purposes Such agents have been listed by the government as biological select agents and toxins The 2001 anthrax letter attacks prompted the creation of new regulations aimed at increasing security for research with dangerous pathogens The outcome of the anthrax letter investigation has raised concern about whether these measures are adequate Responsible Research with Biological Select Agents and Toxins evaluates both the physical security of select agent laboratories and personnel reliability measures designed to ensure the trustworthiness of those with access to biological select agents and toxins The book offers a set of guiding principles and recommended changes to minimize security risk and facilitate the productivity of research The book recommends fostering a culture of trust and responsibility in the laboratory engaging the community in oversight of the Select Agent Program and enhancing the operation of the Select Agent Program

Biosecurity of Select Agents and Toxins Thomas E. Engells, 2005 Summary the concept of biosecurity as it pertains to Biological Select Agents and Toxins in American biomedical institutions is explored in some depth How can specific public biomedical research universities securely use and store biological select agents The thesis outlines the dynamics of the select agent and toxin list the relevant history of the control of biological agents both in the international and domestic settings including federal regulations pertaining to biosecurity 42CFR73 Two specific case studies are presented The biosecurity strategies and tactics at these two distinct biomedical research studies are compared An answer to the research question is proposed and additional areas for research are outlined

Sequence-Based Classification of Select Agents National Research Council, Division on Earth and Life Studies, Board on Life Sciences, Committee on Scientific Milestones for the Development of a Gene Sequence-Based Classification System for the Oversight of Select Agents, 2010-11-08 Select Agents are defined in regulations through a list of names of particularly dangerous known bacteria viruses toxins and fungi However natural variation and intentional genetic modification blur the boundaries of any discrete Select Agent list based on names Access to technologies that can generate or synthesize any DNA sequence is expanding making it easier and less expensive for researchers industry scientists and amateur users to create organisms without needing to obtain samples of existing stocks or cultures This has led to growing concerns that these DNA synthesis technologies might be used to synthesize Select Agents modify such agents by introducing small changes to the genetic sequence or create entirely new pathogens Amid these concerns the National Institutes of

Health requested that the Research Council investigate the science and technology needed to replace the current Select Agent list with an oversight system that predicts if a DNA sequence could be used to produce an organism that should be regulated as a Select Agent A DNA sequence based system to better define when a pathogen or toxin is subject to Select Agent regulations could be developed This could be coupled with a yellow flag system that would recognize requests to synthesize suspicious sequences and serve as a reference to anyone with relevant questions allowing for appropriate follow up Sequence Based Classification of Select Agents finds that replacing the current list of Select Agents with a system that could predict if fragments of DNA sequences could be used to produce novel pathogens with Select Agent characteristics is not feasible However it emphasized that for the foreseeable future any threat from synthetic biology and synthetic genomics is far more likely to come from assembling known Select Agents or modifications of them rather than construction of previously unknown agents Therefore the book recommends modernizing the regulations to define Select Agents in terms of their gene sequences not by their names and called this sequence based classification
