Disposable Bioreactors Regine Eibl, Dieter Eibl, 2009-11-27 Over the past five years, the immense financial pressure on the development and manufacturing of biopharmaceuticals has resulted in the increasing use and acceptance of disposables which are discarded after harvest and therefore intended only for single use. In fact, such disposables are implemented in all the main bioprocess production stages today, and an even higher growth than those in the biopharmaceutical market is predicted, reaching double figures. Alongside disposable filter capsules, membrane chromatography units, tubing, connectors, flexible containers, processing or containing fluids, freezer systems, mixers, and pumps, and fully controlled disposable bioreactors of up to 2,000 L culture volume are already available on the market. Numerous studies highlight the advantages of disposable bioreactors and reveal their potential for simple, safe, and fast seed inoculum production, process development, and small as well as middle volume production, e.g., bioactive substances, viruses for vaccines, and gene therapies, etc. They suggest that such disposable bioreactors, typically characterized by the cultivation chamber or bag from plastic materials, may be advantageous for plant, animal, and microbial cells. Running industrial activities such as CFD modelling, development of single-use process monitoring and control technology, and standardized film formulations are attempting to resolve the limitations of the current disposable bioreactors. These achievements, along with substantial improvements in product yield, will reduce the use of
