Benefit-cost Analysis of Data Used to Allocate Funds Bruce D. Spencer, 1980 *Benefit-Cost Analysis of Data Used to Allocate Funds* Bruce Spencer, 2012-12-06 This monograph treats the question of determining how much to spend for the collection and analysis of public data. This difficult problem for government statisticians and policy makers is likely to become even more pressing in the near future. The approach taken here is to estimate and compare the benefits and costs of alternative data programs. Since data are used in many ways the benefits are hard to measure. The strategy I have adopted focuses on use of data to determine fund allocations particularly in the General Revenue Sharing program. General Revenue Sharing is one of the largest allocation programs in the United States. That errors in population counts and other data cause sizable errors in allocation has been much publicized. Here we analyze whether the accuracy of the 1970 census of population and other data used by General Revenue Sharing should be improved. Of course it is too late to change the 1970 census program but the method and techniques of analysis will apply to future data programs. In particular benefit cost analyses such as this are necessary for informed decisions about whether the expense of statistical programs is justified or not. For example although a law authorizing a mid decade census was enacted in 1976 there exists great doubt whether funds will be provided so a census can take place in 1985. The President's Budget for 1981 allows no money for the mid decade census despite the Census Bureau's request for 1.9 million for planning purposes.

Topics in Statistical Information Theory Solomon Kullback, John C. Keegel, Joseph H. Kullback, 2013-12-01 The relevance of information theory to statistical theory and its applications to stochastic processes is a unifying influence in these TOPICS. The integral representation of discrimination information is presented in these TOPICS reviewing various approaches used in the literature and is also developed herein using intrinsically information theoretic methods. Log likelihood ratios associated with various stochastic processes are computed by an application of minimum discrimination information estimates. Linear discriminant functionals are used in the information theoretic analysis of a variety of stochastic processes. Sections are numbered serially within each chapter with a decimal notation for subsections. Equations, examples, theorems and lemmas are numbered serially within each section with a decimal notation. The digits to the left of the decimal point represent the section and the digits to the right of the decimal point the serial number within the section. When reference is made to a section, equation, example, theorem or lemma within the same chapter only the section number or equation number etc is given. When the reference is to a section, equation etc in a different chapter then in addition to the section or equation etc number the chapter number is also given. References to the bibliography are by the author's name followed by the year of publication in parentheses. The transpose of a matrix is denoted by a prime, thus one row matrices are denoted by primes as the transposes of one column matrices. Vectors Time Series Analysis of Irregularly Observed Data E. Linear Statistical Inference T. Calinski, W. Klonecki, 2013-03-09 An International Statistical Conference on Linear Inference was held in Poznan Poland on June 4 8 1984 The conference was organized under the auspices of the Polish Section of the Bernoulli Society the Committee of Mathematical Sciences and the Mathematical Institute of the Polish Academy of Sciences The purpose of the meeting was to bring together scientists from various countries working in the diverse areas of statistical sciences but showing great interest in the advances of research on linear inference taken in its broad sense Thus the conference programme included sessions on Gauss Markov models robustness variance components experimental design multiple comparisons multivariate models computational aspects and on some special topics 38 papers were read within the various sessions and 5 were presented as posters At the end of the conference a lively general discussion session was held The conference gathered more than ninety participants from 16 countries representing both parts of Europe North America and Asia Judging from opinions expressed by many participants the conference was quite successful well contributing to the dissemination of knowledge and the stimulation of research in different areas linked with statistical linear inference If the conference was really a success it was due to all its participants who in various ways were devoting their time and efforts to make the conference fruitful and enjoyable

0 1 The aim of the book *Our Contributions to a General Asymptotic Statistical Theory* Springer Lecture Notes in Statistics Vol 13 1982 called Vol I in the following suggest to describe the local structure of a general family of probability measures by its tangent space and the local behavior of a functional K_k by its gradient Starting from these basic concepts asymptotic envelope power functions for tests and asymptotic bounds for the concentration of estimators are obtained and heuristic procedures are suggested for the construction of test and estimator sequences attaining these bounds In the present volume these asymptotic investigations are carried one step further From approximations by limit distributions to approximations by Edgeworth expansions 1 2 adding one term of order n to the limit distribution As in Vol I the investigation is general in the sense of dealing with arbitrary families of probability measures and arbitrary functionals The investigation is special in the sense that it is restricted to statistical procedures based on independent identically distributed observations 2 Moreover it is special in the sense that its concern are regular models i.e. families of probability measures and functionals which are subject to certain general conditions like differentiability Irregular models are certainly of mathematical interest Since they are hardly of any practical relevance it appears justifiable to exclude them at this stage of the investigation

Nonparametric

Regression Analysis of Longitudinal Data Hans-Georg Müller, 2012-12-06 This monograph reviews some of the work that has been done for longitudinal data in the rapidly expanding field of nonparametric regression. The aim is to give the reader an impression of the basic mathematical tools that have been applied and also to provide intuition about the methods and applications. Applications to the analysis of longitudinal studies are emphasized to encourage the non-specialist and applied statistician to try these methods out. To facilitate this, FORTRAN programs are provided which carry out some of the procedures described in the text. The emphasis of most research work so far has been on the theoretical aspects of nonparametric regression. It is my hope that these techniques will gain a firm place in the repertoire of applied statisticians who realize the large potential for convincing applications and the need to use these techniques concurrently with parametric regression. This text evolved during a set of lectures given by the author at the Division of Statistics at the University of California Davis in Fall 1986 and is based on the author's Habilitationsschrift submitted to the University of Marburg in Spring 1985 as well as on published and unpublished work. Completeness is not attempted neither in the text nor in the references. The following persons have been particularly generous in sharing research or giving advice: Th Gasser, P Ihm, Y P Mack, V Mammi, tzsch, G G Roussas, U Stadtmüller, W Stute and R
