Mohamed, 2024-02-07

The majority of global seafood production and mariculture activities take place in marine coastal water bodies especially in areas of high primary productivity from microalgae and plankton This productivity sustains many forms of ecosystem services and promotes carbon dioxide absorption However climate change ocean warming acidification oxygen loss etc and anthropogenic disturbances nutrients intrusion aquaculture have influenced the microalgae plankton community assemblage and shifted it into a highly productive zone causing a severe impact on the marine ecosystem such as an increase in Harmful Algal Blooms dead zone expansions and coral algal phase shifts So far there is still little knowledge on the mechanisms of microalgae plankton community response to these changing environmental conditions Harmful microalgae impair the marine ecosystem through the production of the so called shellfish toxins which cause shellfish contamination and poisoning to the vertebrates including humans In addition some microalgae produce fish killing toxins ichthyotoxins causing increasing damage to marine aquaculture Besides that the high productivity bloom of microalgae in the water due to coastal eutrophication from anthropogenic activities is known to induce hypoxic anoxic conditions causing a severe economic impact on aquaculture
