1. The first step in solving a system of linear equations is to write each equation in slope-intercept form. This allows you to compare the slopes of the two lines. If the slopes are different, the lines are not parallel and the system has one solution. If the slopes are the same, the lines are either parallel (no solution) or coincident (infinitely many solutions). To determine if the lines are parallel or coincident, you can compare the y-intercepts. If the y-intercepts are different, the lines are parallel and the system has no solution. If the y-intercepts are the same, the lines are coincident and the system has infinitely many solutions.

2. The second step in solving a system of linear equations is to solve for one variable. This can be done by using the elimination method or the substitution method.
