Machine Learning Sergios Theodoridis, 2020-02-19 Machine Learning A Bayesian and Optimization Perspective 2nd edition gives a unified perspective on machine learning by covering both pillars of supervised learning namely regression and classification The book starts with the basics including mean square least squares and maximum likelihood methods ridge regression Bayesian decision theory classification logistic regression and decision trees It then progresses to more recent techniques covering sparse modelling methods learning in reproducing kernel Hilbert spaces and support vector machines Bayesian inference with a focus on the EM algorithm and its approximate inference variational versions Monte Carlo methods probabilistic graphical models focusing on Bayesian networks hidden Markov models and particle filtering Dimensionality reduction and latent variables modelling are also considered in depth This palette of techniques concludes with an extended chapter on neural networks and deep learning architectures The book also covers the fundamentals of statistical parameter estimation Wiener and Kalman filtering convexity and convex optimization including a chapter on stochastic approximation and the gradient descent family of algorithms presenting related online learning techniques as well as concepts and algorithmic versions for distributed optimization Focusing on the physical reasoning behind the mathematics without sacrificing rigor all the various methods and techniques are explained in depth supported by examples and problems giving an invaluable resource to the student and researcher for understanding and applying machine learning concepts Most of the chapters include typical case studies and computer exercises both in MATLAB and Python The chapters are written to be as self contained as possible making the text suitable for different courses pattern recognition statistical adaptive signal processing statistical Bayesian learning as well as courses on sparse modeling deep learning and probabilistic graphical models New to this edition Complete re write of the chapter on Neural Networks and Deep Learning to reflect the latest advances since the 1st edition The chapter starting from the basic

perceptron and feed forward neural networks concepts now presents an in depth treatment of deep networks including recent optimization algorithms batch normalization regularization techniques such as the dropout method convolutional neural networks recurrent neural networks attention mechanisms adversarial examples and training capsule networks and generative architectures such as restricted Boltzman machines RBMs variational autoencoders and generative adversarial networks GANs Expanded treatment of Bayesian learning to include nonparametric Bayesian methods with a focus on the Chinese restaurant and the Indian buffet processes Presents the physical reasoning mathematical modeling and algorithmic implementation of each method Updates on the latest trends including sparsity convex analysis and optimization online distributed algorithms learning in RKH spaces Bayesian inference graphical and hidden Markov models particle filtering deep learning dictionary learning and latent variables modeling Provides case studies on a variety of topics including protein folding prediction optical character recognition text authorship identification fMRI data analysis change point detection hyperspectral image unmixing target localization and more

Interdisciplinary Bayesian Statistics Adriano Polpo, Francisco Louzada, Laura L. R. Rifo, Julio M. Stern, Marcelo Lauretto, 2015-02-25 Through refereed papers this volume focuses on the foundations of the Bayesian paradigm their comparison to objectivistic or frequentist Statistics counterparts and the appropriate application of Bayesian foundations This research in Bayesian Statistics is applicable to data analysis in biostatistics clinical trials law engineering and the social sciences EBEB the Brazilian Meeting on Bayesian Statistics is held every two years by the ISBrA the International Society for Bayesian Analysis one of the most active chapters of the ISBA The 12th meeting took place March 10 14 2014 in Atibaia Interest in foundations of inductive Statistics has grown recently in accordance with the increasing availability of Bayesian methodological alternatives Scientists need to deal with the ever more difficult choice of the optimal method to apply to their problem This volume shows how Bayes can be the answer The examination and discussion on the foundations work towards the goal of proper application of Bayesian methods by the scientific community Individual papers range in focus from posterior distributions for non dominated models to combining optimization and randomization approaches for the design of clinical trials and classification of archaeological fragments with Bayesian networks

Independent Random Sampling Methods Luca Martino, David Luengo, Joaquín Míguez, 2018-03-31 This book systematically addresses the design and analysis of efficient techniques for independent random sampling Both general purpose approaches which can be used to generate samples from arbitrary probability distributions and tailored techniques designed to efficiently address common real world practical problems are introduced and discussed in detail In turn the monograph presents fundamental results and methodologies in the field elaborating and developing them into the latest techniques The theory and methods are illustrated with a varied collection of examples which are discussed in detail in the text and supplemented with ready to run computer code The main problem addressed in the book is how to generate independent random samples from an arbitrary probability distribution with the weakest possible constraints or assumptions

in a form suitable for practical implementation The authors review the fundamental results and methods in the field address the latest methods and emphasize the links and interplay between ostensibly diverse techniques

Bayesian Theory and Applications Paul Damien, Petros Dellaportas, Nicholas G. Polson, David A. Stephens, 2013-01-24 The development of hierarchical models and Markov chain Monte Carlo MCMC techniques forms one of the most profound advances in Bayesian analysis since the 1970s and provides the basis for advances in virtually all areas of applied and theoretical Bayesian statistics This volume guides the reader along a statistical journey that begins with the basic structure of Bayesian theory and then provides details on most of the past and present advances in this field The book has a unique format There is an explanatory chapter devoted to each conceptual advance followed by journal style chapters that provide applications or further advances on the concept Thus the volume is both a textbook and a compendium of papers covering a vast range of topics It is appropriate for a well informed novice interested in understanding the basic approach methods and recent applications Because of its advanced chapters and recent work it is also appropriate for a more mature reader interested in recent applications and developments and who may be looking for ideas that could spawn new research Hence the audience for this unique book would likely include academicians practitioners and could likely be required reading for undergraduate and graduate students in statistics medicine engineering scientific computation business psychology bio informatics computational physics graphical models neural networks geosciences and public policy The book honours the contributions of Sir Adrian F M Smith one of the seminal Bayesian researchers with his papers on hierarchical models sequential Monte Carlo and Markov chain Monte Carlo and his mentoring of numerous graduate students the chapters are authored by prominent statisticians influenced by him Bayesian Theory and Applications should serve the dual purpose of a reference book and a textbook in Bayesian Statistics
