An Introduction to Computational Learning Theory Michael J. Kearns, Umesh Vazirani, 1994-08-15 Emphasizing issues of computational efficiency Michael Kearns and Umesh Vazirani introduce a number of central topics in computational learning theory for researchers and students in artificial intelligence neural networks theoretical computer science and statistics Emphasizing issues of computational efficiency Michael Kearns and Umesh Vazirani introduce a number of central topics in computational learning theory for researchers and students in artificial intelligence neural networks theoretical computer science and statistics Computational learning theory is a new and rapidly expanding area of research that examines formal models of induction with the goals of discovering the common methods underlying efficient learning algorithms and identifying the computational impediments to learning Each topic in the book has been chosen to elucidate a general principle which is explored in a precise formal setting Intuition has been emphasized in the presentation to make the material accessible to the nontheoretician while still providing precise arguments for the specialist This balance is the result of new proofs of established theorems and new presentations of the standard proofs The topics covered include the motivation definitions and fundamental results both positive and negative for the widely studied L G Valiant model of Probably Approximately Correct Learning Occam's Razor which formalizes a relationship between learning and data compression the Vapnik Chervonenkis dimension the equivalence of weak and strong learning efficient learning in the presence of noise by the method of statistical queries relationships between learning and cryptography and the resulting computational limitations on efficient learning reducibility between learning problems and algorithms for learning finite automata from active experimentation

learning and data compression the Vapnik Chervonenkis dimension the equivalence of weak and strong learning efficient learning in the presence of noise by the method of statistical queries relationships between learning and cryptography and the resulting computational limitations on efficient learning reducibility between learning problems and algorithms for learning finite automata from active experimentation Computational Learning Theory Martin Anthony,1997 Concepts hypotheses learning algorithms Boolean formulae and representations Probabilistic learning Consistent algorithms and learnability Efficient learning The VC dimension Learning and the VC dimension VC dimension and efficient learning Linear threshold networks Computational Learning Theory Martin Anthony,N. Biggs,1997-02-27 Computational learning theory is a subject which has been advancing rapidly in the last few years The authors concentrate on the probably approximately correct model of learning and gradually develop the ideas of efficiency considerations Finally applications of the theory to artificial neural networks are considered Many exercises are included throughout and the list of references is extensive This volume is relatively self contained as the necessary background material from logic probability and complexity theory is included It will therefore form an introduction to the theory of computational learning suitable for a broad spectrum of graduate students from theoretical computer science and mathematics Machine Learning Balas K. Natarajan,2014-06-28 This is the first comprehensive introduction to computational learning theory The author s uniform presentation of fundamental results and their applications offers AI researchers a theoretical perspective on the problems they study The book presents tools for the analysis of probabilistic models of learning tools that crisply classify what is and is not efficiently learnable After a general introduction to Valiant s PAC paradigm and the important notion of the Vapnik Chervonenkis dimension the author explores specific topics such as finite automata and neural networks The presentation is intended for a broad audience the author s ability to motivate and pace discussions for beginners has been praised by reviewers Each chapter contains numerous examples and exercises as well as a useful summary of important results An excellent introduction to the area suitable either for a first course or as a component in general machine learning and advanced AI courses Also an important reference for AI researchers An Introduction to Machine Learning Miroslav Kubat,2021-09-25 This textbook offers a comprehensive introduction to Machine Learning techniques and algorithms This Third Edition covers newer approaches that have become highly topical including deep learning and auto encoding introductory information about temporal learning and hidden Markov models and a much more detailed treatment of reinforcement learning The book is written in an easy to understand manner with many examples and pictures and with a lot of practical advice and discussions of simple applications The main topics include Bayesian classifiers nearest neighbor classifiers linear and polynomial classifiers decision trees rule induction programs artificial neural networks support vector machines boosting algorithms unsupervised learning including Kohonen networks and auto encoding deep learning reinforcement learning temporal learning including long short term memory hidden Markov models and the genetic algorithm Special attention is devoted to

performance evaluation statistical assessment and to many practical issues ranging from feature selection and feature construction to bias context multi label domains and the problem of imbalanced classes
