Kapittel 1.1 - Hva er evolusjon?

Evolusjon er utbredning, og evolusjonsteorien er bakgrunnen for naturens mangfoldige fascinerende fenomener. Det finnes forskjellige typer av evolusjon, blant annet makro-evolusjon og mikro-evolusjon. Mikro-evolusjon forklarer endringene som foregår når genene i populasjonen endrer seg, mens makro-evolusjon forklarer som endringene som foregår når artene går opphør til andre arter over tid. Det som evolusjon er genet, mens det som overlever er de «selektives». «Selektives» er en betegnelse som brukes for å beskrive individer som er bedre egnet i miljøet de befinner seg i. Dette baserer seg på reproduksjon, egenskaper og tilpasningsformer.

Kapittel 1.2 - Mekanismer i evolusjonen

Reproduksjon, variasjon og seleksjon er de tre faktorene i evolusjonen. Med reproduksjon, er det viktig med en hurtig reproduksjon mellom arter og individer. Med variasjon, omhandler dette mer om genet som går i arv. Når vi så ser genet være 100% lik som hos opphavene, og dette bidrar da til variasjonen i populasjonen. Det finnes ulikartet formering der avkommet stort sett er lik opphavet. Det finnes også kjønnet formering der gametene fra kjønnscellene til foreldrene blander seg med gametene. Ettersom gametene kommer halve av fra mor og halve av fra far, vil avkommet være variet. Ved kjønnet formering er det også viktig å huske at det ikke bare er mutasjonene som fører til variasjon, men også feilordet kromosomene fordeles seg og mulige rekombinasjoner i forbindelse med celledeling. Variasjon er altså fundamentet for utbredning. Ettersom variasjonen er liten, vil det føre til store skifter i populasjonen. Seleksjon handler mer om overlevelse i naturen. Det sier at individer som er forskjellige, har større sannsynlighet for å ha og mindre muligheter for å reproducere. Dermed finnes det et begrep, «høy fitness», som omtaler individer som videreformerer gener oftere enn gjennomsnittet.
