Evaporation

On a warm, sunny day, a glass of water seems to slowly disappear. This is because the energy from the sun _____ the water and turns the liquid water into water _____. This process is called _____. When the water _____, it becomes a gas in the _____.

Condensation

As the water vapor rises, it cools off and _____ into water _____. If the water vapor becomes extremely cold, it will form ice crystals instead of water droplets. As the water droplets or ice crystals grow bigger and more numerous, they form _____.

Precipitation

If water droplets or ice crystals become too _____, they can't stay in the air. They _____. Water droplets precipitate as _____, sleet, hail, or _____.

Collection

This precipitation gathers into _____ and streams that flow down to the lakes and oceans. This is called _____. Not all of the water makes it back to the oceans and lakes right away. Some of it is used by animals and _____. Some is frozen into _____. Eventually, the animals and plants breathe the water out and the glaciers melt, releasing the water back into the water _____.

Biogeochemical Cycles Worksheet Doc:

Marine Geochemistry Roy Chester, 2009-04-01 The first edition of Marine Geochemistry received strong critical acclaim and the reviews included the comments that it provides a benchmark in the field and is clearly recognizable as a standard text for years to come Marine Geochemistry offers a fully comprehensive and integrated treatment of the chemistry of the oceans, their sediments and biota. It addresses the fundamental question: How do the oceans work as a chemical system by capitalizing on the significant advances in understanding oceanic processes made over the past three decades. These advances have been facilitated by improved sampling and analytical techniques, a better understanding of theoretical concepts, and the instigation of large sized international oceanographic programs. Designed for use as a text, the book treats the oceans as a unified system in which material stored in the sea water, the sediment and the rock reservoirs interacts to control the composition of sea water itself. Part I covers the transport of material to the oceans via rivers, the atmosphere and hydrothermal systems and discusses their relative flux magnitudes. Part II considers the oceans as a reservoir introducing water column parameters before discussing water column fluxes and the benthic boundary layer. Part III is devoted to the sediment reservoir. The topics covered include diagenesis, the major components of the sediments and the processes controlling the geochemistry of oceanic deposit which are discussed in terms of sediment forming signals. Part IV offers an overview and synthesis of the integrated marine geochemical system. Since the publication of the first edition there have been further significant advances in several areas of the subject. The revised text of this edition accommodates these advances while still retaining the emphasis on identifying key processes operating within a unified ocean. Special attention has been paid to fundamental conceptual changes such as those related to trace metal speciation in sea water, hydrothermal activity, carbon dioxide and the importance of the oceans in world climate change, the transport of particulate material to the interior of the ocean, primary production and iron limitation, colloids and the preservation/destruction of organic matter in marine sediments. Intermediate and advanced students with interests in chemical oceanography, marine geochemistry, marine biology and environmental chemistry will welcome this revised comprehensive text. Other students in the broader field of earth sciences will find it to be an essential reference source dealing with the interaction between the atmosphere, the ocean and the solid earth. Incorporates all significant recent advances in the field. Unified system approach to ocean chemistry. Emphasises geological contexts e.g. sediment diagenesis.

Global biogeochemical cycles Butcher, 1992-08-12 Global biogeochemical cycles **Interactions of C, N, P, and S Biogeochemical Cycles and Global Change** R. Wollast, Fred T. Mackenzie, Lei Chou, 1993 This book is a natural extension of the SCOPE Scientific Committee of Problems on the Environment volumes on the carbon C, nitrogen N, phosphorus P and sulfur S biogeochemical cycles and their interactions. Likens 1981, Bolin and Cook 1983. Substantial progress in the knowledge of these cycles has been made since publication of those volumes. In particular, the nature and extent of biological and inorganic interactions between these cycles have been identified, positive and negative feedbacks

recognized and the relationship between the cycles and global environmental change preliminarily elucidated. In March 1991 a NATO Advanced Research Workshop was held for one week in Melreux Belgium to reexamine the biogeochemical cycles of C, N, P and S on a variety of time and space scales from a holistic point of view. This book is the result of that workshop. The biogeochemical cycles of C, N, P and S are intimately tied to each other through biological productivity and subsequently to problems of global environmental change. These problems may be the most challenging facing humanity in the 21st century. In the broadest sense global change encompasses both changes to the status of the large globally connected atmospheric, oceanic and terrestrial environments, e.g. tropospheric temperature increase and change occurring as the result of nearly simultaneous local changes in many regions of the world, e.g. eutrophication.

The Major Biogeochemical Cycles and Their Interactions Bert Bolin, Robert B. Cook, 1983

Biogeochemical Cycles and Climate A. J. Dolman, 2019. Changing concentrations of greenhouse gases are key to our changing climate. *Biogeochemical Cycles and Climate* examines the interaction of the main biogeochemical cycles of the earth with the physics of climate from the perspective of the earth as an integrated system. Biogeochemical cycles play a fundamental role in the Earth's system; they describe the movement of matter and transfer of energy around the planet. This text aims to answer some fundamental questions: How have the cycles of key nutrients such as carbon, nitrogen, phosphorus and water changed both in the geological past and more recently through the impact of humans on the Earth System? How do these cycles interact with each other and affect the physical properties of climate? How can we use this knowledge to mitigate some of the impacts of changing biogeochemistry on climate and the Earth's habitability and resilience? Understanding the complex interactions of biogeochemistry with the Earth's climate is crucial for understanding past and current changes in climate and, above all, for the future sustainable management of our planet.

Biogeochemistry William H. Schlesinger, 2012-12-02. *Biochemistry: An Analysis of Global Change* provides information pertinent to the chemistry of the surface of the Earth. This book presents the basics about the effect of life on the chemistry of the Earth. Organized into two parts encompassing 14 chapters, this book begins with an overview of the connection between the elements that are significant to life. This text then describes how computer models are employed to help understand elemental cycling and ecosystem function. Other chapters consider how satellite technology is beneficial in understanding global biochemistry. This book discusses as well the essential role that the Earth Observing System (EOS) will play in investigations of global ecology. The final chapter deals with the human effect on global biochemical cycles, with focus on controlling human population growth to maintain life and quality of life on Earth. This book is a valuable resource for college level and graduate students who are interested in global change.
