Process Design, Economics, and Project Engineering Wayne Seames, 2025-11-20 The principal goal of this textbook is to prepare process and chemical engineers for careers in a wide variety of process related jobs This book will also serve as a reference resource for engineers working in the process and process design industries It assumes prerequisite knowledge of material and energy balances heat transfer fluid flow and mass transfer but does not require any prerequisite knowledge of economics process control process safety or material selection Its structure is uniquely organized to follow the project life cycle that is most commonly used by engineering contractors and the operating companies they serve in the process industries

KEY FEATURES Covers both retrofit and new process projects Includes a set of easy to use step by step preliminary equipment sizing methods Offers realistic rules of thumb for equipment sizing and pressure profiles Discusses professional development topics such as time management planning and scheduling teamwork leadership conflict resolution technical writing effective meetings and oral communication Addresses safety and sustainability considerations in process design Includes a unified suite of cost estimating methods for simple retrofits major retrofits and grassroots projects Covers process project economics and how to evaluate process opportunities including a method to estimate economic benefits for difficult to quantify opportunities Includes information on plant layout auxiliary systems and process automation Features homework problems and examples case study example reports Visio drawing templates and Excel workbooks with example calculations for economic analysis This textbook is aimed at advanced undergraduate students in chemical engineering studying process plant design and economics and serves as a handbook for practicing process and process project engineers A solutions manual and lecture slides are available to qualifying adopting instructors

Computational Fluid Dynamics Simulations Guozhao Ji, Jiujiang Zhu, 2020 Fluid flows are encountered in our daily life as well as in engineering industries Identifying the temporal and spatial distribution of fluid dynamic properties is essential in analyzing the processes related to flows These properties such as velocity turbulence temperature pressure and concentration play important roles in mass transfer heat

transfer reaction rate and force analysis However obtaining the analytical solution of these fluid property distributions is technically difficult or impossible With the technique of finite difference methods or finite element methods attaining numerical solutions from the partial differential equations of mass momentum and energy have become achievable Therefore computational fluid dynamics CFD has emerged and been widely applied in various fields This book collects the recent studies that have applied the CFD technique in analyzing several representative processes covering mechanical engineering chemical engineering environmental engineering and thermal engineering
