Haas, 2013-05-21 Explores computer intensive probability and statistics for ecosystem management decision making Simulation is an accessible way to explain probability and stochastic model behavior to beginners This book introduces probability and statistics to future and practicing ecosystem managers by providing a comprehensive treatment of these two areas The author presents a self contained introduction for individuals involved in monitoring assessing and managing ecosystems and features intuitive simulation based explanations of probabilistic and statistical concepts Mathematical programming details are provided for estimating ecosystem model parameters with Minimum Distance a robust and computer intensive method The majority of examples illustrate how probability and statistics can be applied to ecosystem management challenges There are over 50 exercises making this book suitable for a lecture course in a natural resource and or wildlife management department or as the main text in a program of self study Key features Reviews different approaches to wildlife and ecosystem management and inference Uses simulation as an accessible way to explain probability and stochastic model behavior to beginners Covers material from basic probability through to hierarchical Bayesian models and spatial spatio temporal statistical inference Provides detailed instructions for using R along with complete R programs to recreate the output of the many examples presented Provides an introduction to Geographic Information Systems GIS along with examples from Quantum GIS a free GIS software package A companion website featuring all R code and data used throughout the book Solutions to all exercises are presented along with an online intelligent tutoring system that supports readers who are using the book for self study

Decision Modelling for Health Economic Evaluation
Andrew Briggs, Mark Sculpher, Karl Claxton, 2006-08-18 In financially constrained health systems across the world increasing emphasis is being placed on the ability to demonstrate that health care interventions are not only effective but also cost effective This book deals with decision modelling techniques that can be used to estimate the value for money of various interventions including medical devices surgical procedures diagnostic technologies and pharmaceuticals Particular emphasis is placed on the importance of the appropriate representation of uncertainty in the evaluative process and the implication this uncertainty has for decision making and the need for future research This highly practical guide takes the reader through the key principles and approaches of modelling techniques It begins with the basics of constructing different forms of the model the population of the model with input parameter estimates analysis of the results and progression to the holistic view of models as a valuable tool for informing future research exercises Case studies and exercises are supported with online templates and solutions This book will help analysts understand the contribution of decision analytic modelling to the evaluation of health care programmes

ABOUT THE SERIES Economic evaluation of health

interventions is a growing specialist field and this series of practical handbooks will tackle in depth topics superficially addressed in more general health economics books Each volume will include illustrative material case histories and worked examples to encourage the reader to apply the methods discussed with supporting material provided online This series is aimed at health economists in academia the pharmaceutical industry and the health sector those on advanced health economics courses and health researchers in associated fields

Binary Data Analysis of Randomized Clinical Trials with Noncompliance Kung-Jong Lui, 2011-03-31 It is quite common in a randomized clinical trial RCT to encounter patients who do not comply with their assigned treatment Since noncompliance often occurs non randomly the commonly used approaches including both the as treated AT and as protocol AP analysis and the intent to treat ITT or as randomized analysis are all well known to possibly produce a biased inference of the treatment efficacy This book provides a systematic and organized approach to analyzing data for RCTs with noncompliance under the most frequently encountered situations These include parallel sampling stratified sampling cluster sampling parallel sampling with subsequent missing outcomes and a series of dependent Bernoulli sampling for repeated measurements The author provides a comprehensive approach by using contingency tables to illustrate the latent probability structure of observed data Using real life examples computer simulated data and exercises in each chapter the book illustrates the underlying theory in an accessible and easy to understand way Key features Consort flow diagrams and numerical examples are used to illustrate the bias of commonly used approaches such as AT analysis AP analysis and ITT analysis for a RCT with noncompliance Real life examples are used throughout the book to explain the practical usefulness of test procedures and estimators Each chapter is self contained allowing the book to be used as a reference source Includes SAS programs which can be easily modified in calculating the required sample size Biostatisticians clinicians researchers and data analysts working in pharmaceutical industries will benefit from this book This text can also be used as supplemental material for a course focusing on clinical statistics or experimental trials in epidemiology psychology and sociology
