Arwa H. Ibrahim¹, Dhuha N. Boumarah¹, Arwa A. AlGhamdi², Shadi A. Alshammary^{1,2}

ABSTRACT

Background: Hepatic hemangioma represents the most frequent benign tumor originating from the liver. When the tumor exceeds 10 cm, and in some studies 4 or 5 cm, it is considered giant, which accounts for 10% of all hemangiomas arising from the liver. Histologically, Sclerosing hepatic hemangioma, in particular, is an exceedingly rare subtype of hemangioma. Clinically Bornman-Terblanche-Blumgart syndrome is a very rare complication of hepatic hemangioma. **Objective:** The aim of this case presentation was to contribute to the literature by documenting a case of giant sclerosing hemangioma diagnosed in a 36-year-old female presenting with Bornman-Terblanche-Blumgart syndrome, along with a brief review of the literature. **Case report:** The current paper documents two rare clinical and histological features of hepatic hemangioma. Bornman-Terblanche-Blumgart syndrome is complicated a giant hepatic hemangioma found histologically to be sclerosing in nature. Knowledge about the uncommon complications of liver hemangioma permits the implementation of appropriate interventions in a timely manner and, in turn, can enhance the patient's quality of life and minimize rates of associated mortality.

Keywords: Giant Sclerosing Hepatic Hemangioma.

1. BACKGROUND

Hepatic hemangioma represents the most frequent benign tumor originating from the liver. It is formed by clusters of vascular malformations and drives its blood supply from the hepatic artery (1, 2). The prevalence of liver hemangioma has been estimated to reach 20% in autopsy studies (3). When the tumor exceeds 10 cm, and in some studies 4 or 5 cm, it is considered giant, accounting for 10% of all hemangiomas arising from the liver (2, 4, 5). These lesions are usually asymptomatic and present in a solitary pattern (5). Sclerosing hepatic hemangioma, in particular, is an exceedingly rare subtype of hemangioma characterized by the presence of degenerative changes histologically (6). To date, few reports have been published to comprehensively address the clinical features of this uncommon condition.

Bornman-Terblanche-Blumgart syndrome, a triad of abdominal pain and fever with unremarkable laboratory values, is a rare complication of hepatic hemangioma. These syndromic clinical features are recognized as a valid indicator of an ongoing inflammatory process within the hemangioma cavity (7). Although rare, the entity remains clinically significant as it possesses several diagnostic challenges and mandates surgical intervention (8). Herein, we contribute to the literature by documenting a case of giant sclerosing hemangioma diagnosed in a 36-year-old female presenting with Bornman-Terblanche-Blumgart syndrome, along with a brief review of the literature.

2. OBJECTIVE

The aim of this case presentation was to contribute to the literature by documenting a case of giant sclerosing hemangioma diagnosed in a 36-year-old female presenting with Bornman-Terblanche-Blumgart syndrome, along with a brief review of the literature. The present case was reported in accordance with the SCARE guidelines (9).
