Advances in Robot Control

This volume provides a unique collection of papers written in honor of the 70th birthday of Professor Kawamura who has long been recognized as a pioneer in the field of robot control. A summary of his research is reflected in this book, which includes contributions from leading experts in the field, who have also been closely associated with Professor Kawamura at various stages in his distinguished career. The book is built around two themes: the physics-based robot control for coping with the so-called everyday physics problems on one hand, and the challenge of reproducing beautiful, human-like movements on the other hand. These themes defined much of Kawamura's research in the field of robot control and are the cornerstone of his perception of human robotics. Topics covered in the book address natural motion and adaptive control of robot manipulators, visual sensing, sensory-based and iterative learning control, controlled potentials for multi-link systems, force control of hyper-elastic and muscle-activated systems, modeling and analysis of human-like movements in reaching and grasping tasks. Each chapter is self-contained and treats the subject collectively and in depth. This volume will provide an important reference for graduate students and researchers, as well as for engineers and scientists working in the field of robotics.
