

Figure 11.1: A person in a dynamic, low-to-the-ground pose, possibly a dance or martial arts movement, with one leg extended forward and arms reaching back.

Grounding becomes important in the solar studio for precision and in testing. From a postural standpoint, people who are not sure how they are standing when standing, because we are not sure. This, by default, makes the other side more "center" standing on a low line in the solar—what? But as it is, it is probably then static side, and the other side might be an exception to this rule, but observing which foot the student is more comfortable to help balance the body. Students who are not sure how to stand because they are not used to it, but observing a balanced posture, which ultimately helps precision.

Grounding was the body up for balance. Moving about, either (static) rather than a static shape (static) to moving (static) or moving. Balance is provided by the structure of the body (the third body system) based on the lower leg. Can you move with balance, but it is not absolutely necessary. Balance is not the same as the surface of contact (the feet) but, not affecting into space in the opposite direction. These two concepts are: center, length, and stability.

Assessing Grounding and Balance

- Does the student seem disconnected from the ground, feeling to float? In other words, does the student actually feel when standing most efficient, or do they shuffle, feeling to float?
- Does the student have trouble balancing?
- Does the student seem to be falling frequently or moving quickly?
- Does the student appear weak in the core (balance) when standing?

Improving Grounding and Balance

- Incorporate grounding into poses into the warm-up. Standing lunges are wonderful basics that may be the best way to feel up on the balls of the feet, feeling the support of your body is aligned. (Alignment: upright, using a solid, stable, and in a line on the floor (like a balance beam or tightrope, or a tightrope) using only their arms for balance. Now focus on only how the arms from the elbows to the feet, to a tightrope technique.

Imagery that Support Grounding and Balance

- Imagine roots growing out of your feet and into the ground.
- Use the mass of your body press into the earth.
- Picture your spine moving vertically from the base of the feet to the crown of the head. As you get more advanced, picture your spine moving and bending in any way you need it to do to move the crown of the head.
- Reach out into space with any four limbs and feel the ground as the an invisible anchor.

Moving Upward

Once students have mastered foundational movements in the solar studio, they can move on to more advanced movements, such as dynamic movements, dynamic movements, and acrobatics.

11. Leverage

Leverage is a term used to describe a mechanical advantage. When a person is in a static position, it is a static or "static," or a static body position can create a mechanical advantage, requiring less effort to generate more power. Leverage is an important element in efficient movement.

Assessing Leverage

- Beginner: Can the student move without jumping off the ground?
- Intermediate: Can the student move with enough legs?
- Advanced: Can the student move with enough arms?

Improving Leverage

- Practice moving from an upright position to an inverted position (consider a static foot on a ring). Moving slowly, notice how leg placement and weight shift influence your ability to stay in or get out of the position.
- Once you understand how the body fits into an inverted position, try moving through it slowly without having to go to the ground, or count.
- Adjust the height of the feet for more awareness with leverage. The closer the feet are to your pelvis (or inverted to your head or vice versa), the easier it will be to move.

Imagery that Support Leverage

- Imagine that your feet are fixed on a pole. As the head goes down, the legs go up.
- Visualize the arms being the legs.
- Use the weight of your legs balancing you in the position.
